

402 B

Non-return axial guided valve
02 System

Technical Data Sheet

A non-return valve is compatible with many types of fluids and can be adapted to a wide range of installations. However, each of these installations comes with their own particular constraints : mechanical, hydraulic, physical or chemical. The O2 system offers the best compromise between hydraulic performance, ruggedness, sealing-tightness and cost effectiveness with any kind of liquids (subject to a validation of our recommendation service).

Our valves meet the requirements of the Pressure Equipment Directive 2014/68/UE. This range extends from 40 to 500 mm. By its technology, it operates in any position for a lot of applications. It's compact and it doesn't generate hammering.

- **Internal and external Epoxy coating** increasing resistance to corrosion
- **Hydraulic shape** means very little energy loss
- **Bronze guide ring** enables a better movement of the closing system and preventing premature wear
- Excellent sealingtightness ensured by **an EPDM seal**
- **Stainless steel spring** allowing system to function in any position
- 2 drilled bosses 1/2 and plugged for by-pass, control or evacuation
- **Passage for cables** of submersible pumps

Important notice :

The indicated pressure for the different categories of fluids (L1/L2/G1/G2) is under no condition a guarantee of use. Therefore, it is essential to validate the use of products under given operating conditions. The operating instructions are available on our web site www.socla.com or by requesting from our sales department.

Technical features	
Operating temperature	-10°C to 100°C
Permissible operating pressure (PFA) in water	See table above
Maximum permissible pressure (PS) other mediums	See table above
Connection	Flanges drilled PN (see table)
Mediums	Not loaded liquids, gas

10	Seal	EPDM			

Approvals

International construction Standards :

Directive 2014/68/UE

Flange drilling according to EN1092-2

Application

The non-return valve 402B SOCLA is the most universal for water supply, pumps protection, general circuits, boosters and water distribution.

Installation

Installation :

Before putting valve into operation, check that:

- the working conditions are compatible with the details given on the identification plate, the instruction notice and the manufacturer's detail,
- the valve works effectively when tried (carry out a few opening and closing operations of the closing system),
- the valve is free-pollution inside.

On a new installation or after maintenance, the circuit must be rinsed with the valve completely open in order to remove solid matter which may damage the internal parts of the valve.

Commissioning :

The installation should be put under pressure progressively to avoid damage which might occur to internal components.

Make sure that when flow stops the valve maintains pressure well and that there is no water-hammer which might damage the valve or installation.

If there is water-hammer, an anti-water hammer system must be added to the installation.

During a prolonged stoppage, a change in the state of the fluid may result in damage when the installation is brought back into service (solidification...).

Establish an adequate procedure program for cleaning the system.

Maintenance

• Removing :

1. Remove guide assembly (N°2)
2. Remove the o-ring seal (N°5) from its groove
3. Remove the spring (N°4)
4. Remove all the closing system (N°3)

• Reassembly :

Make sure that the seal is in a good condition before reassembly the valve.

Clean and lubricate it if necessary with a suitable product.

1. Put all the closing system (N°3) into the casing (N°1)
2. Insert the spring (N°4)
3. Put the o-ring seal (N°5) in its groove
4. Insert the guide assembly (N°2). This step may require to use a press.

Once the reassembly done, test the device in order to check its sealing.

Operation

Direction for use :

- Solid line : Valve completely open
- Dotted line : opening stage of valve

DN	Opening pressure in mm CE				Kv	ζ
	mm	↑	↓	↔
