SATURN

Argal fiberglass reinforced pumps range

ARGAL SATURN chemical pump series consists of single-stage, horizontal axis centrifuges which conform to ANSI/ASME B73.1. regulations.

The pump bodies, made completely in FRP (thermosetting resins reinforced with fiberglass), do not need protective fairing or metallic reinforcement. Particular construction concepts and rules, in fact, provide these pumps with a considerable mechanical resistance, a resistance comparable to certain metal alloys.

The use of different formulas of the base resin (epoxy-vinylester) enables the expansion of the spectrum of chemical resistance and this makes the pumps suitable and resistant to almost all moderately abrasive corrosive chemical agents.

The combination of chemical and mechanical resistance, as well as the substantially low cost of the solutions proposed, has lead the SATURN range to be the new point of reference in the field of pumps for application in sea water (from sanitation treatments to desalination), purification of industrial water and domestic water, anti air-pollution systems and generally in production processes which use liquid chemicals systems.

FIBERGLASS RESIN	APPLICATIONS
V1G standard vinyl ester resin compound	General purpose
V1A vinyl ester resin compound	Abrasive liquids
V1C vinyl ester resin compound	Bleaches applications
V1F vinyl ester resin compound	Fluoridric applications
E1S Epoxy resin	Strong chemical and solvents

PUMP VERSIONS

SATURN pumps come in two different versions: normalized ZGS (long-coupled), with its own independent mechanical support and mono-block ZMS (close-coupled), more practical and economical.

ZMS. The mono-block pump, which comes in versions of up to 37kW in power, offers an important novelty with both functional and application advantages. The thrust bearing block lodged in the electric motor bracket especially designed to support the radial burden, reducing the shaft's jolts and consequently the burden on the motor's bearings. This gives a greater resistance to the entire pump-motor unit and consequently the capacity to endure heavier applications.

ZGS. The independent mechanical bearings support connected with electric motor by the flexible joint coupling offers the advantage of a longer life of all mechanical parts of the pump and motor, even in the heaviest applications characterized by a continuous use. Coupling by means of a flexible joint eases the dismantling of the pump and motor which are lodged on the same base . The 'back pull out' characteristic enables the operator to dismantle the support and the rotating hydraulic parts without disconnecting the pump's body from the system and without moving the electric motor from the base.

MARKET	APPLICATIONS
Aquariums/Zoos	Salt water
Chemical Process	Acids
	Chemical waste
	Waste water
Desalination	Filtration
	Seawater In-take
	Chemical Transfer
	Concentrated Brine
Electric Utilities	Coal pile run-off
Electronics	Acids
	Chemical waste
Metal Finishing	Chromic acids
	Pickling acids
	Plating solutions
Petrochemical	Acids
	Chemical waste
Pharmaceutical	Organic Solvents
Pulp and Paper	Bleach
Mining	Abrasives and Corrosives
Scrubbers/Odor Control	Acids and Caustics

MECHANICAL SEALS

SATURN pumps can be installed with various types of mechanical seals, both those produced by ARGAL and those produced by other leading Manufacturers. These can be classified by type of installation (single internal or external, double flushing) and by the materials used for the sliding parts and the packing. The metal parts are never in contact with the pumped fluid.

SEAL FLUSHING ARRANGEMENTS

All mechanical seals require flushing to lubricate the seal faces and maintain normal operating temperatures. Seals are normally flushed with either a clean external fluid or by the liquid being pumped.

INTERNAL COVER FLUSH

This option removes seal heat by circulating high pressure liquid internally through the drilled rear cover to the seal chamber and then recirculating this liquid back to the impeller.

MOTOR

Standard motors are IEC and NEMA.
