

ARGAL

CHEMICAL PUMPS
sealed close coupled pumps

ZM centrifugal

ZMA self-priming

ZM and **ZMA** are different configurations of the same range of centrifugal axle pumps, self-priming which offers reliability in use. Specifically designed to handle chemical and corrosive fluids.

The whole structure has been conceived in order to make all the components extremely resistant to the aggression, even in the smallest parts.

The pump is close coupled and the parts are supported by the motor, therefore the dimensions are restricted.

Front suction, central upward delivery, mechanically sealed with sliding counterfaces (with an external, single or double flush) or radial elastic ring.

The motors with specially designed shaft and flange are usually IP 55 protected, with Class F Insulation, 240/400 voltage, three phase with 50/60 Hz frequency.

ZM

This range is close coupled, with pump casing supported directly by the motor. These are optimal when needed to transfer chemicals with a specific gravity up to 1,8. Three different motors are available for each model.

The impeller is open, so there is no contraidication to transfer liquids containing solids in suspension.

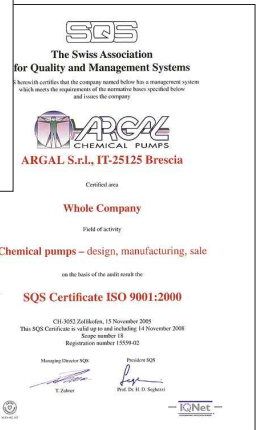

ZMA

Self-priming without the need of having check valves.

Thanks to the specific structure, after the first filling, they are able to self-prime automatically even in presence of empty pipes.

Negative suction head of 5 meters (to be reduced according to the specific gravity).

As in the ZM range, there are different motors available and the impeller is open.

GENERAL PERFORMANCE CURVES

NOTES. All curves are referred to: water at 20°C - viscosity 1 °E - specific gravity 1 kg/dm³

THE MATERIALS

table 2

Version	Reinforced Polymers	Min temp.	Max temp.	Environment temp.
WR	GFR-PP	-5°C (23°F)	80°C (176°F)	0÷40°C (14÷104°F)
WF	GFR-PP/PVDF	-5°C (23°F)	80°C (176°F)	0÷40°C (14÷104°F)
FC	CFF-PVDF	-30°C (-22°F)	110°C (230°F)	-20÷40°C (-4÷104°F)
QR	UPVC/PVDF	0°C (32°F)	40°C (104°F)	0÷40°C (14÷104°F)

WR - The main resin is PP (polypropylene) reinforced with 30% glass fibre. It has a good mechanical resistance and has good dimensional stability when hot.

WF - The main resin is PP (polypropylene) reinforced with 30% fibre glass. The main components are in PVDF because this material has got a higher resistance to abrasion and use.

FC - The main resin is PVDF (Vinylidene polyfluoride) reinforced with 20% fibre glass. Good resistance to abrasion and is also mechanically resistant.

QR - Main resin is PVC (Polyvinyl chloride). Other parts are made in PVDF. This version is particularly suitable to chromic acid, sulphur nitrite mixtures, sulphuric acid, sodium hypochlorite, turpentine and ozone.

ELASTOMERS

table 3

Version	Material	Description
V	FKM	Fluorine elastomer
E	EPDM	Ethylene-propylene rubber
K	FFKM	Perfluorelastomer

TECHNICAL SPECIFICATIONS

1 Stable dimension and strong structure guaranteed by the molding of thermoplastic materials; these features are insured by the thickness of each part.

2 Bracket with large windows in order to void accumulation of corrosive vapours

3 Solid plastic open impeller with metal core to allow frequent start-stop cycles

4 Diaphragm: special building procedure limits the damages in case of dry running and allows a quicker intervention and easy maintenance

5 Sleeve: a good protection of the shaft

6 Simple construction: only two parts (casing and bracket) carry out all the hydraulic and mechanical process by reducing the surface of static sealage (OR)

7 Total interchangeability of the most common mechanical seals. There are different types according to the liquid pumped

8 Screws and nuts in stainless steel

ZM 32/125 with T4 mechanical seal

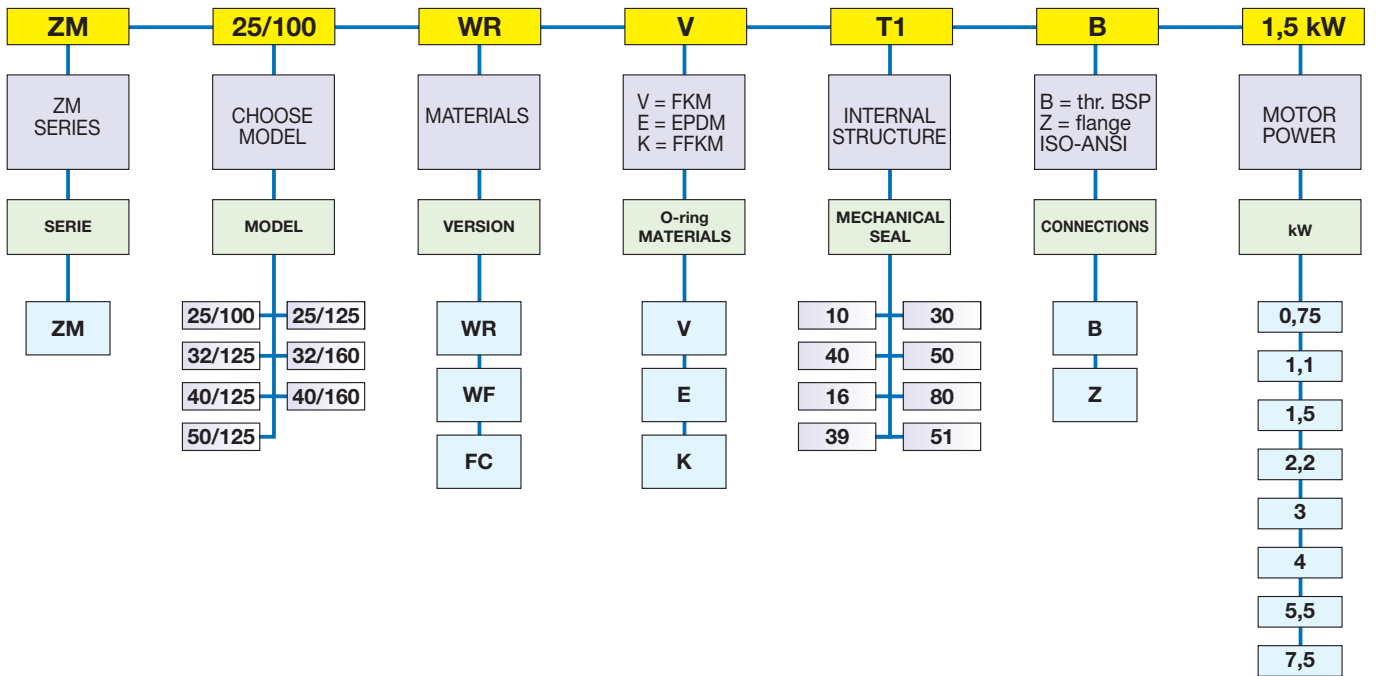

ZM 50/125 with T6 double mechanical seal

ZMA 413 with T3 mechanical seal

IDENTIFICATION LABEL

INSTALLATIONS PROCEDURE

If the specific gravity is more than 1 Kg/dm³ the maximum suction head is to be reduced (see diagram 1).
 If the temperature is more than 20 degrees Celsius the maximum suction head is to be reduced (see diagram 2).
 To self-prime liquid with considerable emission of fumes at normal condition (1 atm; 20 °C) is permittable with limited suction head (e.g. HCL).
 Maximum value of kinematic viscosità iis 10 cSt.
 An increase of the nominal diameter of the pipes involves an extension of the self-priming time.
 In presence of suction horizontal pipes the priming time is extended (e.g. at Ha = 5 m with horizontal pipe lenght of one meter the priming time is of 5.2 minutes [only 4.2 min. with vertical pipe]).
 Planning the complex system do keep the priming time less than 6 min. ad the NPSH value more than 0,4 atm. (for liquids at room temperature).
 Siphon-shaped pipes (filled with liquids) could hamper the air flow during the priming phase.
 In the suction tank the surface of the liquids must be at atmospheric pressure.
 The delivery pipe outlet has to work at atmospheric pressure.

table 8

table 9

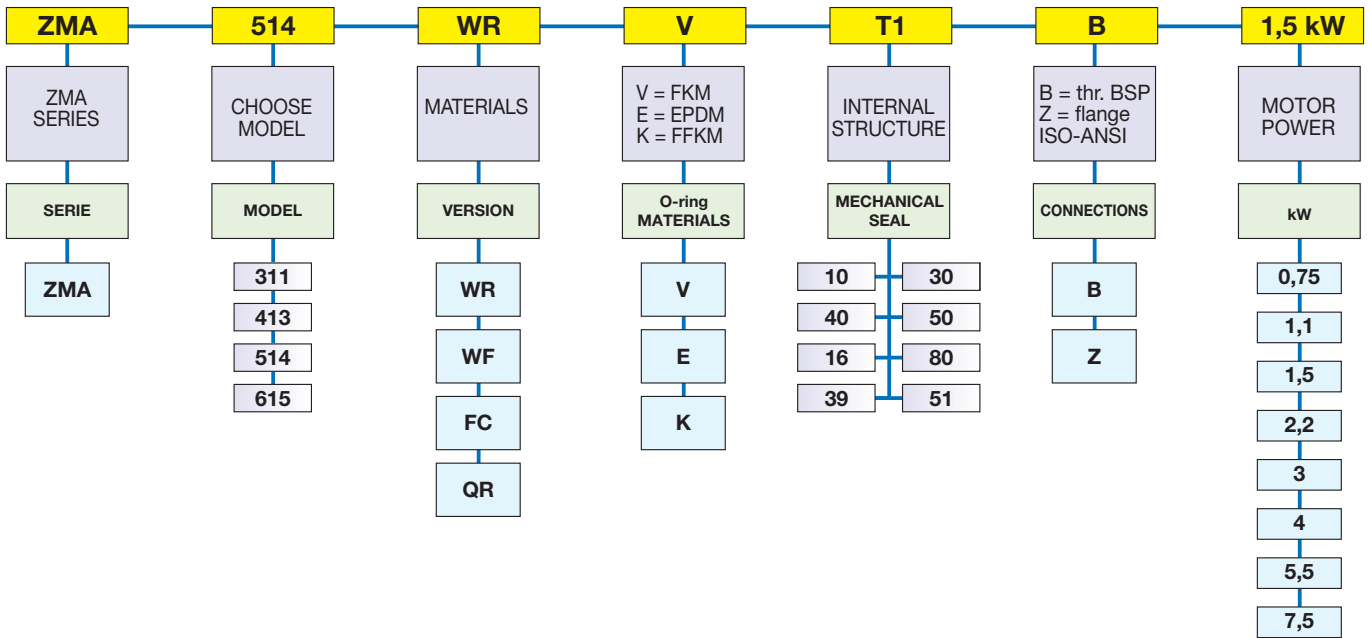

Example:

liquid: NaOH 42 Bè ($\gamma = 1,41 \text{ Kg/ dm}^3$) $T = 40^\circ \text{C}$
 plant: HA = 2 m
 suction head check
 diagram 1: HA max (rif.: $\gamma = 1,41 \text{ Kg/ dm}^3$) = 3,5 m
 diagram 2: rH (rif.: $T = 40^\circ \text{C}$) = 0,7; HA max = $3,5 \times 0,7 = 2,45 \text{ m}$ (> 2 ; OK).
 Please contact us in order to give you our technical support and assistance.
 $\gamma = (\text{Kg/dm}^3)$ specific gravity of the liquid.
 TS = boiling or decomposition temperature ($^\circ\text{C}$).
