Water: Water Transport

Submersible Pump in Discharge Tube

Amacan S

Main applications

- Irrigation and drainage pumping stations
- Stormwater pumping stations
- Raw and clean water pumps in water works
- Cooling water pumps in power stations and in industry
- Industrial water supply
- Water pollution and flood control
- Pumps for docks and locks
- Aquaculture

Fluids handled

- Grey waste water
- River water
- Stormwater
- Activated sludge
- Seawater

Operating data

Characteristic	Value	
Flow rate	Q	up to 3000 l/s
Head	H	Up to 40 m
Motor rating	P ₂	Up to 420 kW
Temperature of fluid pumped ¹⁾	t	Up to 40 °C

¹⁾ Higher temperatures on request

Designation

Example: Amacan S 1000-655 / 250 8 UTG2

Key to the designation

Code	Description	
Amacan	Type series	
S	Impeller type, e.g. S = mixed flow impeller	
1000	Nominal diameter of the discharge tube [mm]	
655	Nominal impeller diameter [mm]	
250	Motor size	
8	Number of motor poles	
	4	4-pole
	6	6-pole
	8	8-pole
UT	Motor version	
	UT	
	UA	
G2	Material variant	
	G2	
	G3	

Design details

Design

- Fully floodable submersible pump in discharge tube (submersible motor pump)
- Not self-priming
- Close-coupled design
- Single-stage
- Vertical installation

Drive

- Three-phase asynchronous squirrel-cage motor

Shaft seal

- Two bi-directional mechanical seals in tandem arrangement, with liquid reservoir
- Leakage chamber

Impeller type

- Open or closed mixed flow impeller

Bearings

- Grease-packed rolling element bearings

Materials

Description	Material
Pump casing	JL 1040
Motor housing	JL 1040
Shaft	1.4021 / 1.4057
Impeller	1.4517 (duplex steel)
Casing wear ring	Stainless steel
Screws, bolts and nuts	Stainless steel

Coating and preservation

Paint

- **Surface treatment:** SA 2 1/2 (SIS 055900) AN 1865
- **Primer coat:** Primer coat on unfinished casting 0.025 mm to 0.035 mm
- **Top coat:** Environmentally-friendly KSB standard coating (RAL 5002)

Special coating

- Available on request (extra charge and a longer delivery period apply).

Product advantages / customer benefits

- Three-phase motor and optimum motor cooling by fluid handled make for efficient power utilisation.
- The pump's own weight ensures self-centring seating in the discharge tube, and an O-ring seals it; quick to install or remove.
- The slim motor minimises discharge tube flow losses.
- High reliability thanks to bearing temperature monitoring, vibration sensor, thermal motor protection, leakage sensors in the motor and connection space, and leakage monitoring of the mechanical seal system.
- Low-vibration hydraulic system; inlet ribs and optimised bellmouth for vortex-free inflow.

Acceptance tests / Warranties

Functional test

- Each pump is subjected to a performance test to KSB Standard ZN 56535.
- Operating data is guaranteed to DIN EN ISO 9906 / 2 / 2B.

Acceptance tests

- Acceptance tests to ISO/DIN or comparable standards are available against a surcharge.

Warranties

- Quality is assured by means of an audited and certified quality assurance system to DIN EN ISO 9001.

Selection information

Information for pump selection

The guaranteed point of submersible pumps in discharge tubes is measured at a head 0.5 m above the motor (DIN 1184). The documented characteristic curves refer to this data. This must be taken into account when calculating system losses. The indicated heads and performance data apply to pumped fluids with a density $\rho = 1 \text{ kg/dm}^3$ and a kinematic viscosity ν of up to $20 \text{ mm}^2/\text{s}$.

The pump input power must be matched to the density of the fluid handled:

$$P_{2\text{req}} = \rho_{\text{fluid}} [\text{kg/dm}^3] \times P_{2\text{docu}}$$

The operating point with the largest pump input power is decisive for the operating range of the motor. To compensate

the unavoidable tolerances of the characteristic curves of system, pump and motor we recommend selecting a motor size which provides sufficient power reserves.

Recommended minimum reserves²⁾

Required pump input power [kW]	Motor power reserve	
	Mains operation	With frequency inverter
< 30	10 %	15 %
> 30	5 %	10 %

Intake chamber

Determine the minimum water level $t_{1\text{min}}$ (diagram in general arrangement drawing):

The minimum water level $t_{1\text{min}}$ is the water level required in the pump's suction chamber to ensure:

- that there is a sufficient liquid cover above the hydraulic system (propeller) (shown in diagram depending on pump size)
- that the pump does not draw in air-entraining vortices (shown in diagram depending on flow rate)
- that there is no cavitation in the hydraulic system (check against the $\text{NPSH}_{\text{required}}$ value indicated in the technical literature). The following conditions must be met:
 - $\text{NPSH}_{\text{available}} > \text{NPSH}_{\text{required}} + \text{safety allowance}$
 - $\text{NPSH}_{\text{available}} = 10.0 + (t_1 - t_3 - h_7/2)$
 - Safety allowance:
up to $Q_{\text{opt}} \Rightarrow 0.5 \text{ m}$
larger than $Q_{\text{opt}} \Rightarrow 1.0 \text{ m}$

Head (H)

The total pump head is composed as follows:

$$H = H_{\text{geo}} + \Delta H_V$$

H_{geo} (static head)

- Without discharge elbow – Difference between suction-side water level and overflow edge
- With discharge elbow – Difference between suction-side and discharge-side water level

ΔH_V (losses in the system)

- Starting 0.5 m downstream of the pump: e.g. pipe friction, elbow, swing check valve, etc.

Losses by inlet, riser and elbow

Losses are caused by the inlet, riser and elbow (or free discharge).

- Losses in the riser up to the indicated reference level (0.5 m above the motor) are taken into account in the documented characteristic curves.
- Inlet and elbow losses are system losses and must be taken into account for selection.
- For information on structural requirements, pump installation and pump sump design please refer to the KSB know-how brochure "Planning information: Amacan submersible pumps in discharge tubes" 0118.55.

²⁾ If larger reserves are stipulated by local regulations or are required to compensate for uncertain factors in system calculations, these larger reserves must be provided.

Table of fluids handled

The table below for your guidance is based on KSB's long-standing experience. The data are standard values and are not to be considered as generally binding recommendations. More detailed advice is available from our specialist department in Halle. Make use of our laboratory's wealth of experience when selecting materials.

Fluid pumped ³⁾ not containing stringy material	Notes, recommendations
Waste water (without long fibres and large solid particles)	Pre-screen with fine screen.
Surface water (stormwater, river water)	Pre-screen.
Activated sludge	Max. dry substance 2 %
Seawater ⁴⁾	Material variant G3 up to t = 25 °C ⁵⁾

Space between screen bars

Size	Coarse screen	Fine screen ⁶⁾
	[mm]	[mm]
650-364	40	15
650-365	40	15
650-404	40	15
650-405	40	15
800-505	40	15
800-535 / 850-535	40	15
850-550	40	15
900-600 / 1000-600	50	25
900-615 / 1000-615	50	25
900-620 / 1000-620	40	15
1000-655	60	25
1300-820	60	25

3) Fluids to be pumped which are not listed in this table usually require higher-grade materials. Request particulars.
 4) Use of anodes required (efficiency reduced by 2 % to 3 %); anode to be checked every 6 to 12 months
 5) For t > 25 °C contact KSB (stainless steel variant).
 6) Fine screens must be used for high pollution loads.

Notes on material

Duplex stainless steel (1.4517 or technically equivalent material)

This type of carbon steel is corrosion-resistant, has good strength characteristics and is used for high circumferential speeds. This ferritic-austenitic stainless carbon steel is the preferred material for handling acidic waste water with a high chloride content as well as seawater and brackish water due to its excellent resistance to pitting corrosion. Its good chemical resistance, e.g. also against phosphorous and sulphuric acid contained in waste water, has made this material become a popular choice for a wide range of applications in the chemical and process industries. Even in brines and chemical effluent (pH 1–12), waste water and landfill seepage waters, pumps made of duplex steel have a long service life.

Data to be indicated in the purchase order

- Designation of the pump
- Flow rate Q
- Head H_{total}
- Type and temperature of the fluid pumped
- Voltage, frequency, starting method, cable length
- Quantity and language of operating manuals
- Required accessories
 - For discharge tubes indicate all required elevations and the type of installation.
 - For flow-straightening vanes indicate the type of installation and whether the design is with or without suction umbrella.
 - For a support rope indicate dimension "L", the number of lifting rings (depending on the lifting height of the hoisting tackle) as well as the elevations and type of installation.

⁷⁾ Pump set with cathodic protection (anodes to be checked every 6 to 12 months) and top coat of 250 µm

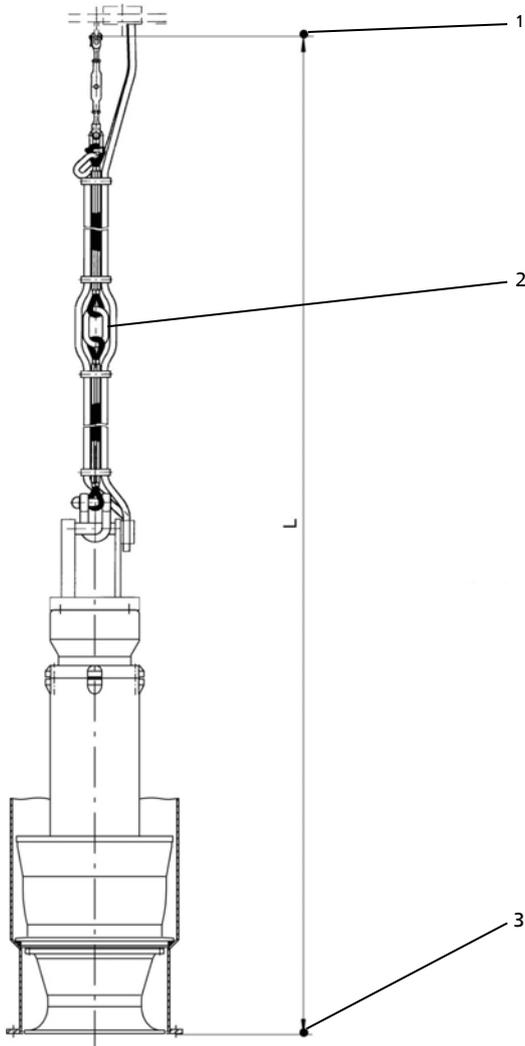

⁸⁾ Sizes 900/1000-620

⁹⁾ Nitrile butadiene rubber (Perbunan)

¹⁰⁾ FPM fluoro rubber variant available as an option against a surcharge

¹¹⁾ JS 1030 on motors: 120 6 ... 205 6 TG, 85 8 ... 120 8 TG; all other motors S235JRG2

Always define dimension "L" when ordering a support rope to allow the correct length to be determined. The lifting height of the crane must be taken into account when ordering a support rope. This determines the number of lifting rings required for installing the pump in or removing it from the discharge tube.

1	Suspension arrangement attached to cover (or cross beam for BU/BG)
2	Optional lifting ring
3	Lower edge of discharge tube = lower edge of pump

Length L and number of lifting rings

- Length L = _____ [mm]
- and number of lifting rings: _____ [Qty.]

The support rope is an accessory and can be supplied with lifting rings and a support spacer (⇒ Page 31) as an option. The basic version is supplied without lifting rings.

³²⁾ Pump set complete with 10 m power cable and 5 m support rope

Installation types

Six design variants are available, depending on the installation type:³³⁾

Installation types

<p>BU discharge tube Design with above floor discharge outlet for installation in open intake chamber</p>	<p>BG discharge tube Design with above floor discharge outlet for installation in covered intake chamber, for low suction-side water levels</p>
<p>CU discharge tube Design with underfloor discharge outlet for installation in open intake chamber</p>	<p>CG discharge tube Design with underfloor discharge outlet for installation in covered intake chamber, for low suction-side water levels</p>
<p>DU discharge tube Design with above floor discharge nozzle for installation in open intake chamber</p>	<p>DG discharge tube Design with above floor discharge nozzle for installation in covered intake chamber, for low suction-side water levels</p>

³³⁾ For information on the different installation types (foundation dimensions, intake chamber, etc.) see general arrangement drawings

Scope of supply

Depending on the model, the following items are included in the scope of supply:

- **Basic model:** Pump set complete with 10 m power cable
- O-ring
- Back-up name plate

Accessories (optional):

- Support rope
- Accessories for cable support
 - Spacer
 - Turnbuckle
 - Support spacer
 - Shackle
 - Cable clamps
- Cable support sleeves
- Flow-straightening vane to prevent floor vortices
- Discharge tube in various designs (steel or GFK)

Accessories

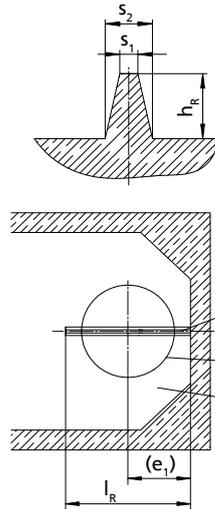

Flow-straightening vane and intake chamber

- The anti-swirl baffles in the bellmouth must be aligned with the flow-straightening vane.
- The bail of the pump is oriented in the same direction as the anti-swirl baffles in the bellmouth.

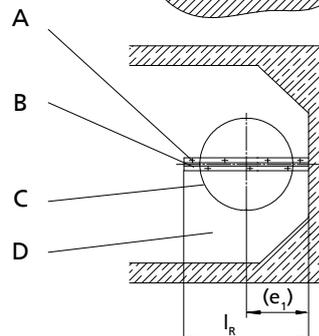

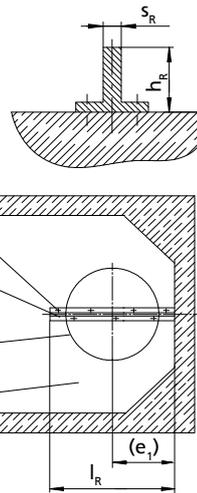

Design of the intake chamber wall surfaces (to prevent vortex formation)

The flow-straightening vane is indispensable for the inlet conditions of the pump set. It prevents the development of a submerged vortex (floor vortex) which could cause a drop in performance, for example. In addition, the floor and wall surfaces of the intake chamber should be designed as a rough concrete surface. Rough surfaces minimise the separation of boundary layers that may cause wall and floor vortices.

Variant 1 (concrete variant)
Flow-straightening vane cast from concrete

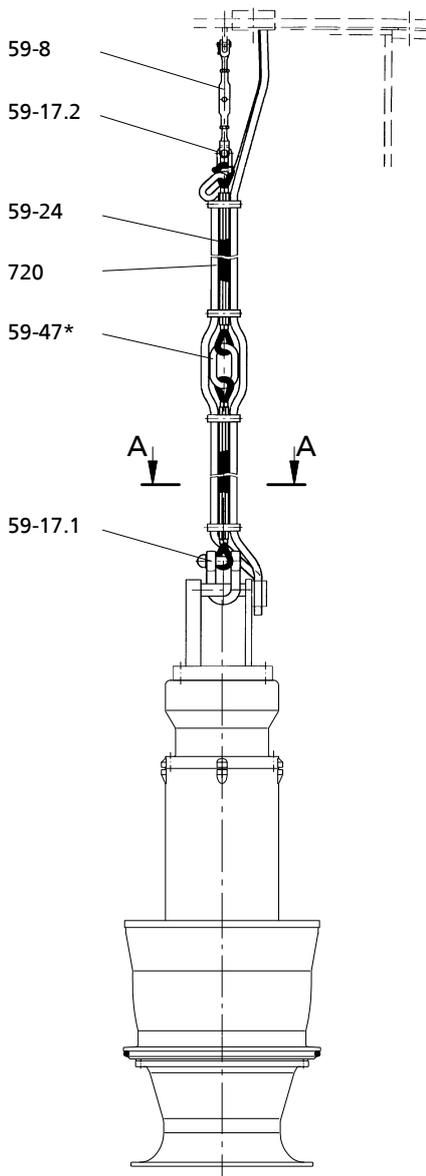

Variant 2
Steel section

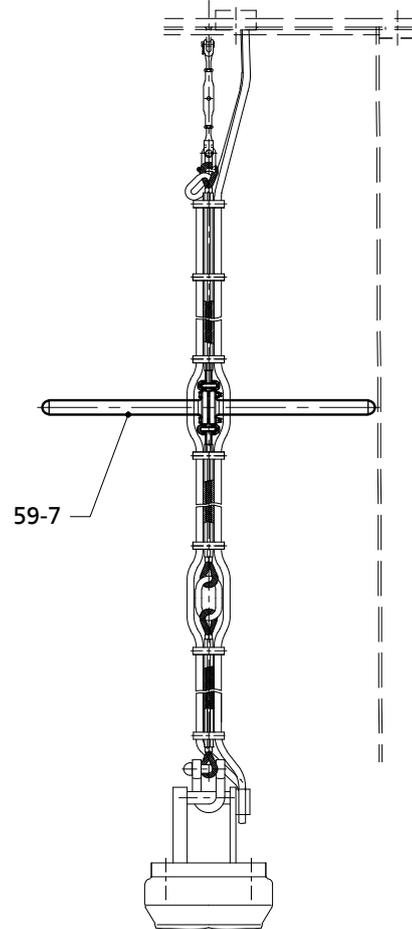

A	Bolted to the floor of the intake chamber	C	Discharge tube
B	Flow-straightening vane centred beneath the discharge tube	D	Intake chamber
The dimensions of the flow-straightening vane depend on the type of installation (see General Arrangement Drawings)			

Support rope and turnbuckle in the discharge tube

**For large installation depths
(with support spacer)**

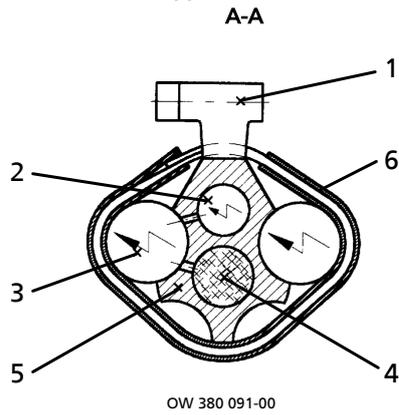

*= The number of (optional) lifting rings depends on the lifting height of the hoisting tackle and on the building structure.

List of components

Part No.	Description	Material
59-8	Turnbuckle	Stainless steel
59-17.2	Shackle	Stainless steel
59-47	Lifting lug	Stainless steel
59-24	Rope to DIN 3088, type PK, low rotation design	Stainless steel
720	Spacer	EPDM
59-17.1	Shackle	Galvanised steel (stainless steel optional)
59-7	Support spacer	GFK

Cross-section of cable support

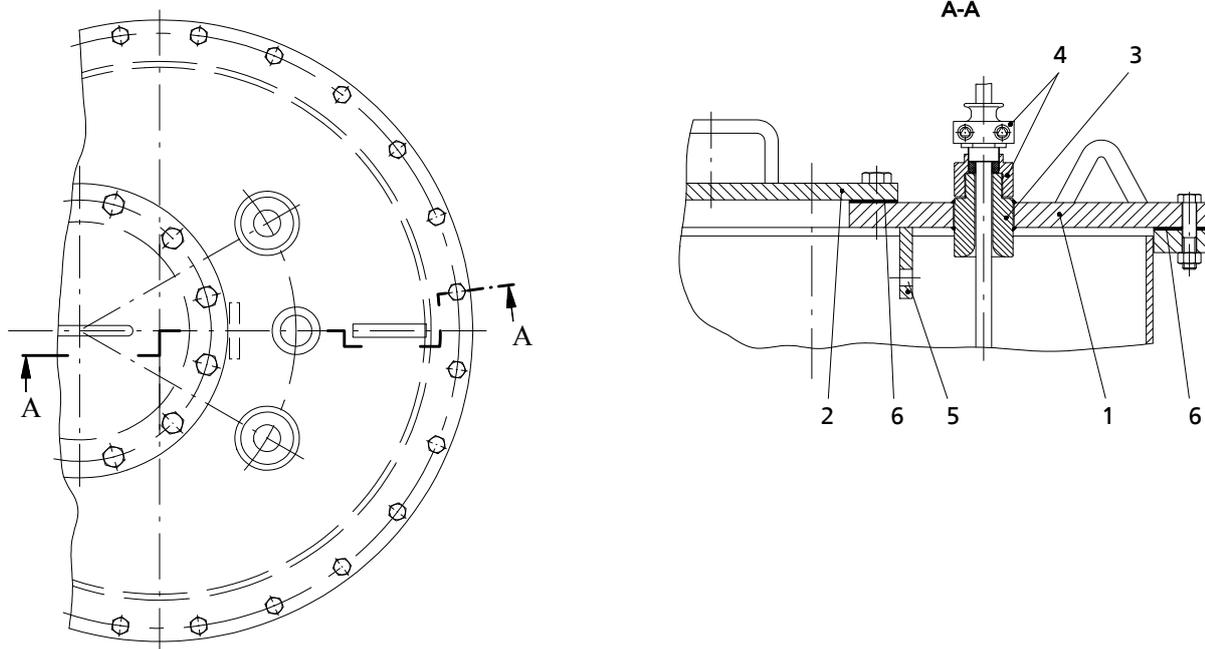

List of components

Part No.	Description	Part No.	Description
1	Cable clamp (approximately every 400 mm)	4	Support rope 59-24
2	Control cable	5	Spacer
3	Power cable	6	Clamp cover

Discharge tube cover with cable gland

Design: with welding sleeve

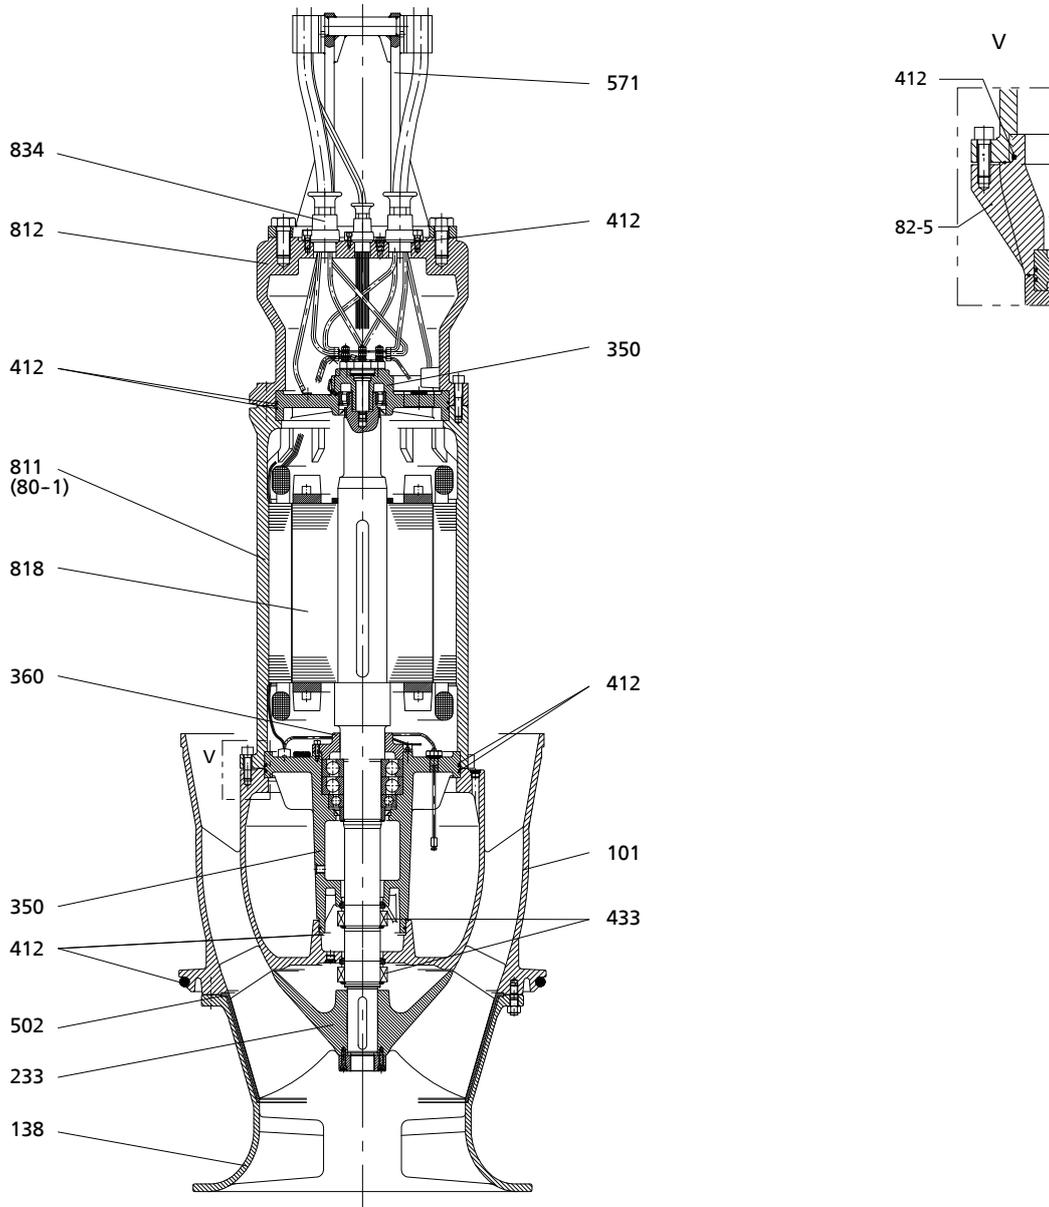

List of components

Part No.	Description
1	Discharge tube cover
2	Cover
3	Welding sleeve
4	Threaded bush with cable entry to DIN 22419 with strain relief and protection against kinking and twisting
5	Eyeplate for fastening the cable support (support rope)
6	Gasket, e.g. rubber with fabric reinforcement
