BOOSTER SETS GV SERIES

GENERAL INTRODUCTION - PRODUCT DESCRIPTION

Lowara GV series booster sets are designed to transfer and increase the pressure of water, in the following applications:

- Hospitals
- Schools
- Public buildings
- Industries
- Hotels
- Condominiums
- Sports facilities
- Mains water systems

GV series booster sets are pumping stations assembled with two up to a maximum of six vertical multistage pumps from the e-SV series.

The pumps are connected to one another by suction and delivery pipes, and fixed onto a single base. The pumps are connected to the manifolds by means of stop valves and check valves.

An electric protection and control panel is installed using a bracket on the base of the set. In the case of particularly large electric panels, they are installed on the floor.

GV series booster sets offer different regulating possibilities and are divided into the following versions:

GV series F

Pressure boosting sets with 2 to 6 e-SV series pumps and only one frequency converter inside the electric panel. Variable speed operation alternates between pumps in the booster set.

GV series E

Pressure boosting sets with 2 to 6 e-SV series pumps and only one frequency converter inside the electric panel. Variable speed operation remains fixed on the same pump.

GV series booster sets have been defined with a wide range of pumps to satisfy the different needs of every system. However, Lowara can also offer the GV series with customisation to satisfy particular working requirements.

Systems for regulating the speed of the electric motors, as in GV series booster sets, are used in the following cases:

- In the case of systems with a lot of users where the daily consumption varies frequently and in different periods.
- When it is necessary to obtain constant pressure.
- In the case of systems with supervision it is possible to monitor and check the performances of the pump stations.

These systems improve comfort for the final user, reducing the noise emissions and, thanks to the gradual switching off of the pumps, they guarantee a significant reduction of water hammer in the system.

BOOSTER SETS GV SERIES DESCRIPTION OF OPERATION

In Lowara GV series booster sets only one electric pump operates at variable speed, while the others operate at fixed speed.

The pump is driven by a frequency converter directly inside the electric panel; the other pumps, up to a maximum of five, are started by contactors.

All the pumps are controlled by the SD60 control unit which is on the front of the electric panel door.

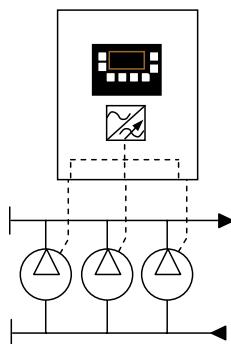

The pump driven by the inverter modulates its speed according to the system demand, while the other pumps run at maximum speed.

The first pump to start will always be the one connected to the frequency converter, the other pumps will start in sequence after the first. It is possible to have automatic alternation of the fixed-speed pumps to distribute wear and allow the pumps to operate for a uniform number of hours.

Starting and stopping of the pumps is determined according to the set value of pressure in the control board menu. The pressure value is read by a pressure transducer connected to the SD60 control unit.

Example operation of a set of three GV series pumps, version F.

Only example for GVF120...

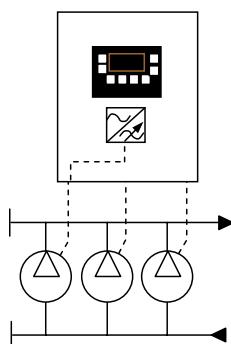

Only one pump is controlled by the converter inside the electric panel. At each new starting cycle of the pumps, the frequency converter moves on to the next pump, ensuring speed adjustment is alternated for all the pumps installed.

When the demand for water decreases, the pumps will stop in cascade and the last one to stop will be the one connected to the frequency converter.

The pump connected to the frequency converter keeps the pressure constant by modulating the number of motor revs.

Example operation of a set of three GV series pumps, version E.

Only example for GVE120...

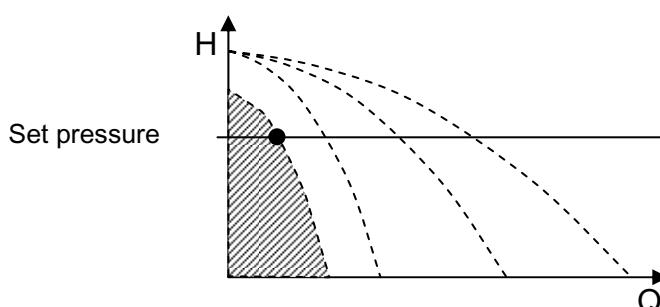

Only one pump is controlled by the converter inside the electric panel. At each new starting cycle of the pumps, the frequency converter always controls the same pump.

When the demand for water decreases, the pumps will stop in cascade and the last one to stop will be the one connected to the frequency converter.

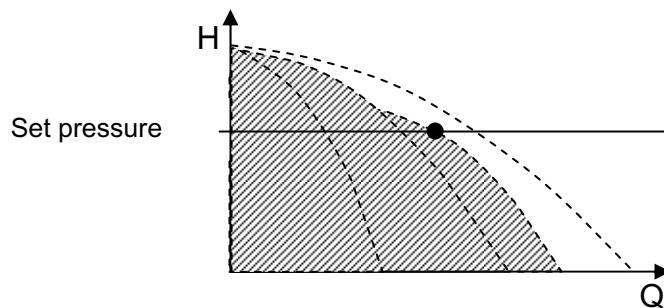

The pump connected to the frequency converter keeps the pressure constant by modulating the number of motor revs.

Lowara GV series booster sets guarantee constant pressure of the system as in the following example:

BOOSTER SETS GV SERIES DESCRIPTION OF OPERATION

When there is a demand for water, the pump controlled by the converter will start, positioning its speed to guarantee the set pressure value. When the demand for water increases, the other pumps will start operating at maximum speed, while the first pump connected to the converter will start to modulate its speed to maintain constant pressure.

When the demand for water decreases, the pumps switch off in cascade, depending on the pressure value. The first pump (running at variable speed) decreases the number of revs to a set minimum before switching off.

Regulating the constant pressure value

GV series booster sets guarantee constant pressure of the system even during frequent variations in water consumption. When the booster set is connected to the system, the pressure value is read through the transducer fitted on the delivery of the system. The value found is compared with the set value. The check between the pressure value found and the set value is made by means of the PID regulator, which corrects the difference between the two values, acting on the frequency variation/number of motor revs, modifying the pump performance over time.

The PID regulator is in the SD60 control board.

In the event of breakdown of the frequency converter, the SD60 board automatically takes control of the booster set functions.

Type of control

GV series booster sets use a sensor as a standard device to control pressure. For each booster set there are two transducers (one standby) where, in the event of breakdown of the first, control automatically passes to the second. The SD60 control board allows the use of other control devices such as flow, temperature or level transducers, according to the needs of the system. It is possible to set the measuring unit directly from the control board menu. These control devices must be specifically requested, as they are not used as standard features on GV series pressure booster sets.

Setpoint

With the SD60 it is possible to set up to six setpoints with different values, as well as the original setpoint. In this way the booster set can be used for systems with a large extension and different levels. For example, different setpoints can be used for an irrigation system on a hillside, or one setpoint value can be used for domestic water supply during the day and a second setpoint for irrigation at night.

The setpoints may be changed by means of a timetable, set via the clock inside the SD60 control board or with an external consent (external device).

BOOSTER SETS GV SERIES DESCRIPTION OF OPERATION

Timing the starting and stopping of the pumps

This function allows the improvement of the reaction time on starting or stopping of the pumps, in order to satisfy the demand of the system while optimising the number of stops and starts per hour.

Each time a pump starts or stops, if the correct delay time for that type of system has been set, the pump will stop or start only after a certain period of time. This allows the pump to remain operating without having to stop at the set pressure value. This prevents the pump restarting suddenly immediately after stopping due to a sudden lowering of the pressure due to the demand for water.

A good adjustment of the pump starting and stopping times will avoid an excessive number of starts per hour.

Standby pump

It is possible to use a standby pump on GV series booster sets, which will start up only if there is a breakdown in one of the pumps in the set. The standby pump will become like a regular pump, controlled in the same way as the others. If the cyclical exchange of pumps is activated, the standby pump will operate automatically.

The performance of the booster set is guaranteed with the standby pump, even if one of its pumps is out of service.

Cyclical exchange of pumps

If this function is activated, working hours will be equally shared among the installed pumps. At each restart the pumps are exchanged, even using those which are never activated because water demand is lower than the booster set performance.

It is also possible to force a cyclical exchange if the pumps have been running for long periods without stopping. The time at which the pumps will be exchanged can be set directly from the menu of the SD60 control board, rather than automatically.

Automatic auto-test

In GV series booster sets it is possible to activate the automatic auto-test function; this function is used when the pumps do not operate frequently.

The main purpose of the automatic auto-test is to start the pumps to avoid blocking of the mechanical seal due to impurities left by the pumped liquid, and to eliminate any air pockets left trapped in the pump.

The automatic auto-test can be activated from the menu of the SD60 control board and its day and duration are set using the clock.

It is possible to order GV series booster sets with the auto-test already set; in this case a water discharge circuit will be provided on the delivery manifold.

It is important to remember that a discharge circuit with a solenoid valve must be provided to avoid overheating the water inside the pump body during the auto-test.

Protection against dry running

The protection function against dry running intervenes if the water reserve to which the booster set is connected falls below the minimum level guaranteed for suction.

For GV series booster sets the level may be controlled by a float, level probes or minimum pressure switch.

It is also possible to manage the function directly by inputting a minimum pressure value in the SD60 control board menu, which will receive a signal from the pressure transducer.

BOOSTER SETS GV SERIES CHOICE AND SELECTION

The following conditions should be considered when choosing a booster set:

- The system's requirements should be met regarding flow rate and pressure.
- The booster set must not be oversized, avoiding unnecessary installation and running costs.

Generally water distribution systems such as those for domestic water supply or for large agglomerates such as hospitals, hotels or similar, have "variable" water consumption i.e. in a 24-hour period there may be sudden variations in consumption that are difficult to foresee.

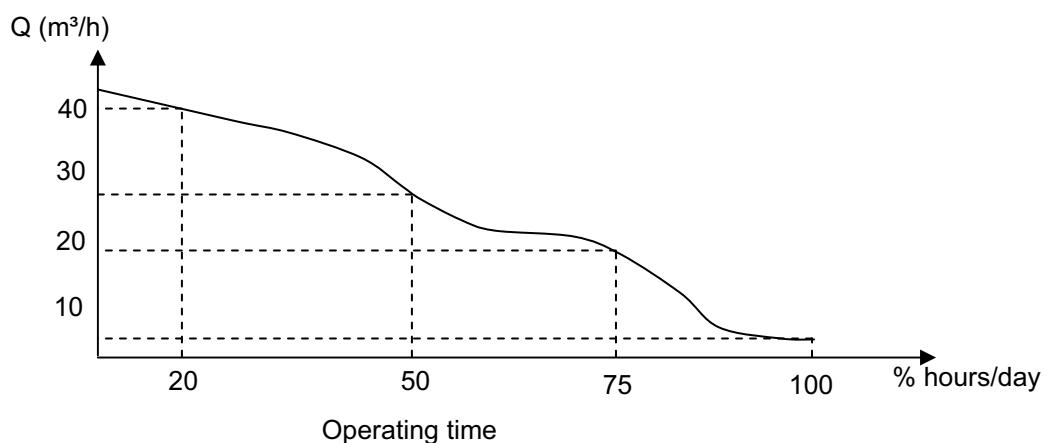

A pattern of consumption may occur in 24 hours, but the daily percentage of booster set operation may also occur at various flow rates.

Generally the definition of flow rate for these types of systems is based on either the "probability calculation" which is a very complex system of calculation, or based on tables or diagrams in the national standards which provide guidelines for the sizing of the systems and therefore for calculating the maximum simultaneous flow rate.

The operating time of the booster set, still calculated over 24h, gives us a view of the daily percentage of operation at the various flow rates.

This means that there may be daily peaks where the maximum flow rate requested is concentrated in a short space of time. In the example given below, it can be seen that in 100% of the time there is a consumption of 4 m³/h, while in 20% of the operating time there is a consumption of 40 m³/h.

BOOSTER SETS GV SERIES CHOICE AND SELECTION

When selecting the booster set the consumption figure of the system must be considered, which is generally supplied by the person who designed the system.

For systems where consumption varies continuously and suddenly over time it is advisable to install GV series booster sets with variable regulation of the pump speed.

The calculation of the size of the booster set (its performance and the number of pumps) is based on the take-off point and therefore on the consumption value which takes the following factors into account:

- The value of the peak in consumption
- Efficiency
- NPSH
- Standby pumps
- Jockey pumps
- Diaphragm tanks

By adjusting their operation over time, variable-speed booster sets give the end user energy savings which can be calculated directly on the control board with a metering module fitted in the electric panel.

This allows checking of the system efficiency, especially in complex systems with many users and many ranges of consumption.

It is possible to install a standby pump if it is necessary to have some kind of additional safety in the pump station. This is typical in systems of a certain importance, such as hospitals or factories, or in the field of crop irrigation.

If small users have to be served in the same system, it is preferable to install what is commonly called a jockey pump, where instead of running the main pump, which usually has higher power, the service is guaranteed with a smaller pump and therefore lower energy consumption.

GV series booster sets must also be equipped with diaphragm tanks (for the size of the tank, see the specific chapter in this catalogue).

A single tank can be installed on the delivery side of the booster set, or smaller tanks, maintaining the same total volume.

Diaphragm tanks avoid the risk of water hammer, which is harmful for both the system and the pumps.

Generally for systems with highly variable or sudden variations in consumption, it is recommended to install a booster set with variable pump speed, such as the GV series, to guarantee constant pressure.

SELECTING THE PUMPS

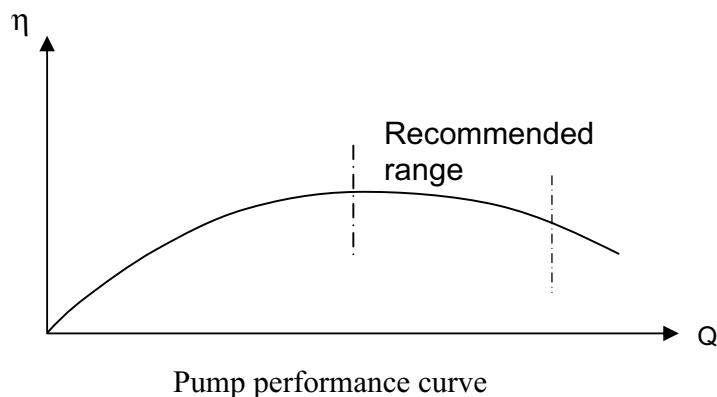

What type of pump to choose?

Generally, the choice of pump is based on the take-off point of the system, which is usually the highest possible. The maximum request value is normally for short periods, so the pump must also be able to satisfy variable requests throughout its time in service.

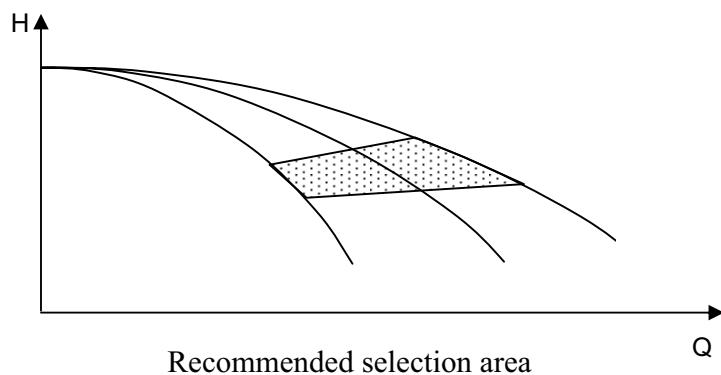

BOOSTER SETS GV SERIES SELECTING THE PUMPS

Generally the choice of the pump, based on the performance curve, should fall around the maximum efficiency point. The pump must ensure operation within its rated performance.

Since the booster set is sized according to the maximum possible consumption, the take-off point of the pumps must be in the area on the right of the performance curve so that, if there is a fall in consumption, the efficiency remains high.

If we make a choice on the characteristic curve of the pump, we can see that the area where it is best to select the pump is represented by the following graph:

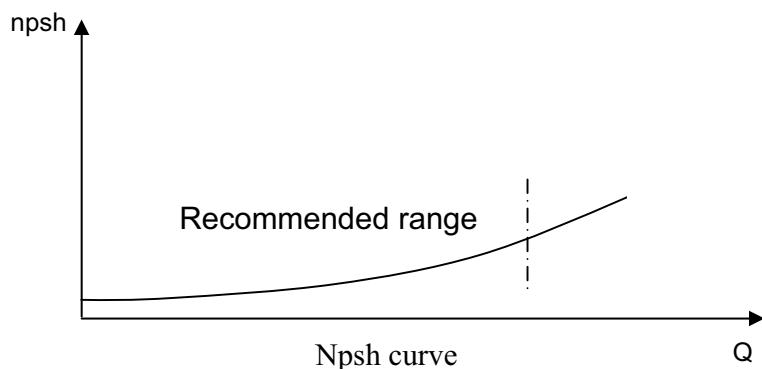

Another factor to be considered when choosing the pumps is its npsh value. Never choose a pump where the take-off point is too far to the right of the npsh curve.

This risks not having good pump suction, which may be aggravated by the type of installation (where negative suction is possible).

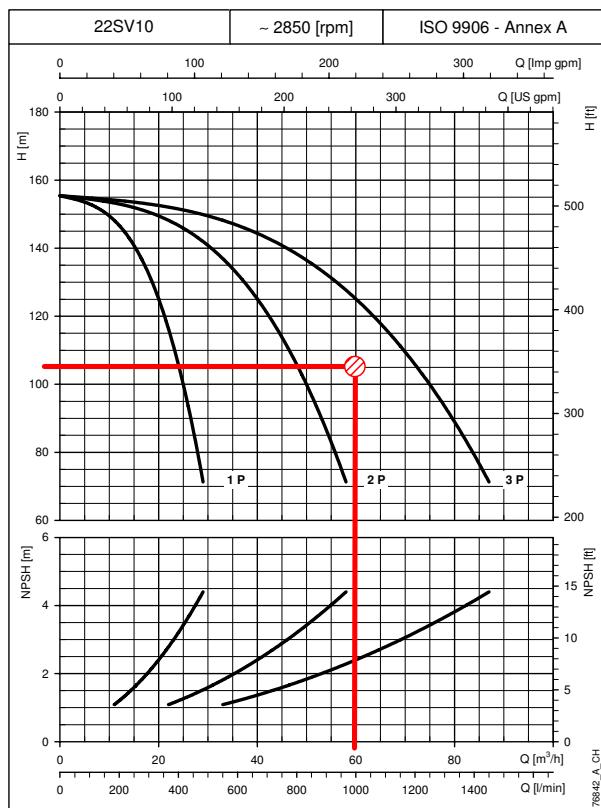

In these cases there is the risk of cavitation.

The npsh of the pump must always be checked at the maximum flow rate requested.

BOOSTER SETS GV SERIES SELECTING THE PUMPS

The choice of pump is therefore based on the characteristic curve of the pump depending on the flow rate and the pressure required for the system. Starting from the required flow rate, a vertical line is drawn until it meets the horizontal line of the required pressure. The point of intersection of the lines gives both the type and the number of pumps necessary for the system.

The example alongside refers to a required flow rate of $60 \text{ m}^3/\text{h}$ and a pressure of 110 water column.

As may be seen from the selection, the system requires three pumps of the type 22SV10 as indicated top left in the table.

Moreover the take-off point falls in the npsh area farthest to the left and therefore in an area with a low cavitation risk.

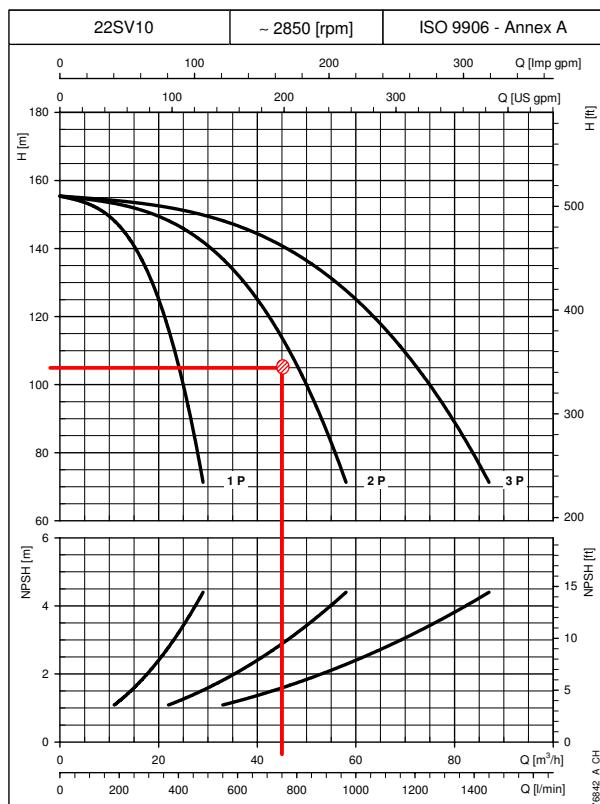

The values obtained are those for the performance of the pumps. A correct check of the net pressure value must be made due to the intrinsic load loss of the booster set and the conditions of installation.

For this reason it is recommended to see the specific chapter in this catalogue.

BOOSTER SETS GV SERIES CALCULATING NET PRESSURE

When selecting the GV series of pressure booster units, reference must be made to pump performance. Performance is calculated from the characteristic curves of the pumps and does not consider any pressure drops generated by pipes and valves as in the pressure booster units. To help choose the right pressure booster unit and calculate the correct pressure at the delivery manifold, the following example is shown:

given the duty point $Q = 42 \text{ m}^3/\text{h}$ $H = 105 \text{ mca}$ and with two pumps working, the pump with the most suitable characteristic curve is chosen, that is, the one with a curve that guarantees the required flow and head values.

From the example, we have chosen the 22SV10 series pump which guarantees system performance. The pump curve is slightly oversized, but this provides a safety margin to counter the pressure drops in the pressure booster unit pipes. To know the effective pressure at the delivery manifold outlet, the pressure drops in the suction and delivery lines of each pump are calculated.

To simplify calculations, the pressure drop curves for each pump, on page 115 of this catalogue, are used.

Assuming a pressure booster unit with check valves on the suction line (curve B of Hc pressure drops) has been selected, one proceeds as follows:

The Hc pressure drops on the pump suction line are evaluated on the "B" curve. At a flow rate of $21 \text{ m}^3/\text{h}$ the value of $H_c = 2,8 \text{ m}$.

Similarly, the Hc pressure drops on the delivery line of the pump, as evaluated on the "B" curve, are analysed. At a flow rate of $21 \text{ m}^3/\text{h}$, the value of H_c is $0,035 \text{ m}$.

The total pressure drop on the delivery and suction lines is therefore $2,84 \text{ m}$.

As regards the pressure drop in the suction and delivery manifolds, 5% with respect to the pressure drops in the pump suction and delivery can be considered.

In this case, therefore, the value is $0,142 \text{ m}$.

The total pressure drop is approximately: 3 m .

Analysing the performance of the unit at a flow rate of $42 \text{ m}^3/\text{h}$, the head H is 115 m .

The net pressure at the delivery manifold is $115 - 3 = 112 \text{ m}$.

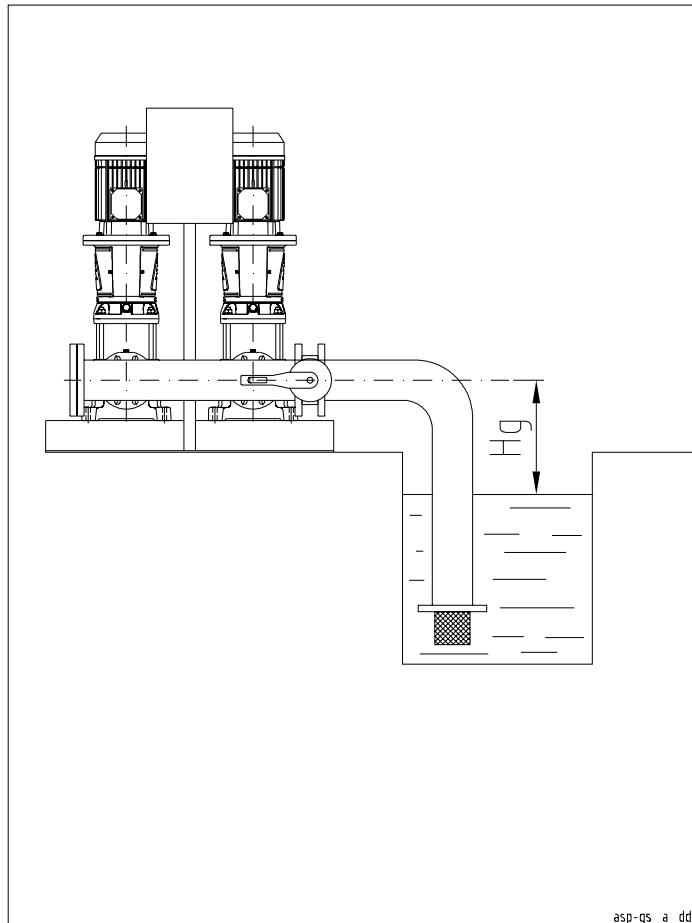

Comparing this value with the rated value, $112 \text{ m} > 105 \text{ m}$.

The unit can therefore satisfy the demand of the system.

BOOSTER SETS GV SERIES SUCTION CONDITIONS

The above example does not consider the suction conditions of the pressure booster unit which, similarly, affect final performance. It is therefore always best to check the suction line for leaks, especially as regards positive head installations.

An example of positive head installation relative to the above case is shown below:

In the positive head installation, the designer must calculate the minimum installation height H_g of the pump in safety conditions in order to avoid cavitation and, therefore, de-priming of the pump.

The relationship that must be checked and which connects this measurement is the following:

$NPSH \text{ available} \geq NPSH \text{ requested}$ where equality is the limit condition.

$$NPSH \text{ available} = P_{atm} + H_g - \sum \text{pressure drops.}$$

Where:

P_{atm} is the atmospheric pressure, equal to 10,33 m
 H_g is the geodetic difference in level

The pressure drops are connected with to the suction piping and relative valves (foot and cut-off valves)

$NPSH \text{ requested}$ is a pump parameter taken from the performance curve of the pump which in our case, at a flow rate of 21 m³/h corresponds to 2,5 m. Before calculating the $NPSH \text{ available}$, the suction pressure drops are calculated using the tables on pages 135-136 in this catalogue, considering a material such as steel.

The chosen diameter of the suction piping is DN80.

90° curve DN80 = 2,11 m

Damper DN80 = 0,28 m

Drain valve DN80 = 0,3 m (calculated from supplier data)

Piping DN80 = 0,61 m (assuming a length of 2,5 m)

Piping DN80, intake manifold = 0,04 m (length of manifold 0,61 m)

Pressure drops on pump suction side (curve B) = 2,8 m

$\sum \text{pressure drops} = 6,1 \text{ m}$

Remembering that: $NPSH \text{ available} = 10,33 + H_g - 6,1$

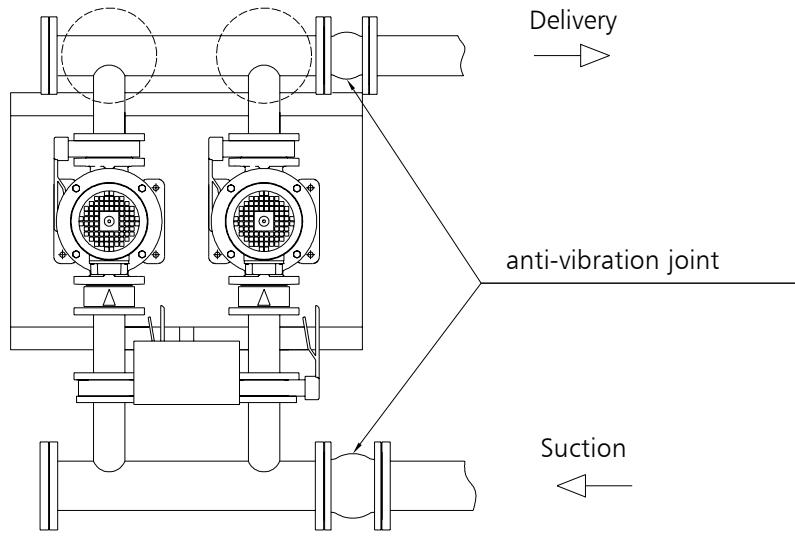

Replacing: $10,33 + H_g - 6,1 \geq 2,5$

$H_g = 2,5 + 6,1 - 10,33 = - 1,73 \text{ m}$ representing the limit, for which reason: $NPSH \text{ available} = NPSH \text{ requested}$

Generally speaking, therefore, in order to assure correct operating conditions as regards the risk of cavitation, the pump must be positioned above the level of the tank so that the suction height is lower than the limit value of 1,73 m.

BOOSTER SETS GV SERIES INSTALLATION

GV series booster sets must be installed in areas protected against frost and with adequate ventilation to cool the motors. It is good practice to connect the suction and delivery pipes with vibration-damping joints to limit vibrations and resonance in the whole system.

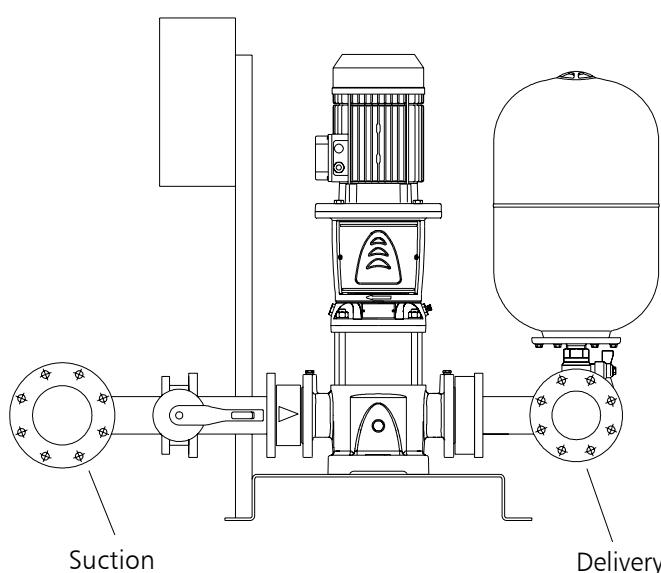

antiv-gs_b_dd

GV series booster sets must be connected to pressurised tanks with an adequate capacity for the system. These tanks can avoid any problems due to water hammer that is created due to the sudden stopping of the pumps running at a fixed speed. For this type of system, 24-litre diaphragm tanks can be used that perform a pressure dampening function, since they do not have to provide water storage like ordinary autoclave systems. Due to their design, variable-speed booster sets can satisfy users' demands by moderating the pump speed. It is always recommended to check the type of system to be made and choose the correct capacity of the diaphragm tank accordingly.

For the sizing of the diaphragm tanks, see the specific chapter in this catalogue.

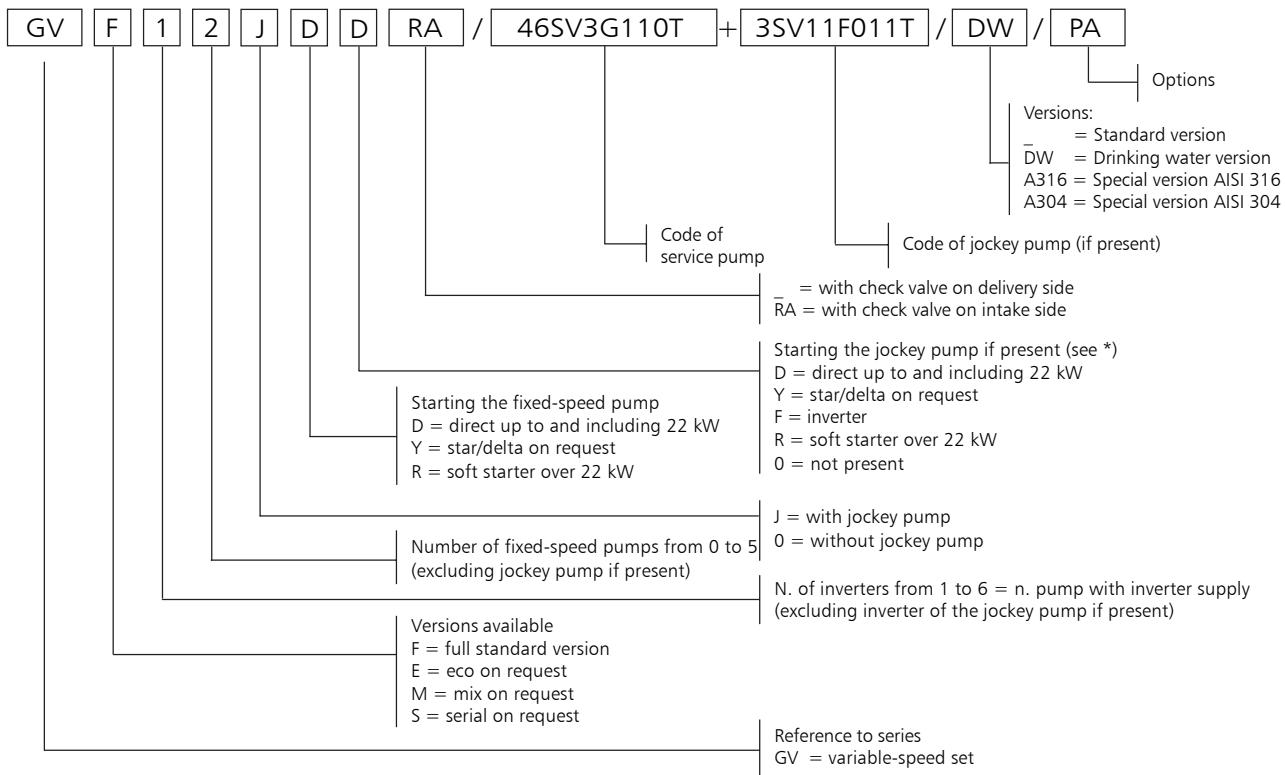

Considering also that variable-pressure sets are very sensitive to swings of pressure in the system, the use of diaphragm tanks allows the pressure to stabilise when requests are low or nonexistent, and avoids the pumps remaining in operation at minimum speed without stopping.

It is good practice to check the value of the maximum pump pressure to match the set with a tank suitable for the pressure value.

serb-gs_c_dd

SET IDENTIFICATION CODE

OPTIONS (ON DEMAND)

- 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
- 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
- 60 Booster set with 60Hz supply voltage.
- BAP High pressure switch installed on the delivery manifold.
- C9 Delivery manifold at 90° with bend. The expansion vessels cannot be installed directly on the manifold.
- CM Suction or delivery manifold larger than standard size.
- CP Clean contacts version: converter faulty, start/stop for each pump.
- IP65 IP65 version control panel.
- KV Kit voltmeter.
- MA Pressure gauge installed on suction manifold.
- NL Dutch market version.
- PA Minimum pressure gauge installed on the suction manifold for dry-running protection.
- PQ Booster set with higt suction pressure (pressure gauge/pressure switches/pressure transmitter increased of one range).
- RA Non return valves mounted on suction side (Es. GHV20RA/SV...).
- RE Heaters inside the control panel, with thermostat.
- SA No intake: no suction valves and suction manifold.
- SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
- SCA No suction manifold (suction valves present).
- TS Booster set with pumps equipped with special mechanical seals.
- UK UK market version.
- VA Electric control panel fitted with analogue voltmeter and ammeter.
- WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m.
- PP Control by pressure switches; in the event of malfunction of the transmitters the set runs at fixed speed (if enabled).

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
- C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
- A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
- C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
- DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

VERSIONS

GVF System composed of 2 to 6 electric pumps and **only one** inverter. Auto-exchange of the inverter on the electric pumps. Exchange by means of a sequence of electrically interlocked contactors.

GVE System composed of 2 to 6 electric pumps and **only one** inverter always connected to the same pump.

GVM System composed of 2 to 6 electric pumps and more than one inverter (Available from 09-2012).

GVS System composed of 2 to 6 electric pumps. Each pump is fed by an inverter (Available from 09-2012).

* In versions GVF, GVE GVM the jockey pump is only fixed speed. In GVS versions the jockey pump may have fixed or variable speed.

SERIES GVS-GVM

SPECIAL VERSIONS WITH MULTI-INVERTER OPERATION (ON REQUEST)

The SD60 control board is able to run variable-speed booster sets even with several frequency converters. These systems must be chosen according to the type of installation and the type of service. For installations where it is necessary to supply water continuously for 24 hours, it is preferable to have a more balanced system, therefore using several inverters. In installations where the request is more variable, even in very limited spaces of time and in continuous duty, systems with variable-speed pumps are preferred.

In water supply installations such as water mains, where the power of the pumps installed is very high, a multi-inverter system may be provided, ensuring a saving in energy consumption.

N.B.: the following versions will be available on request.

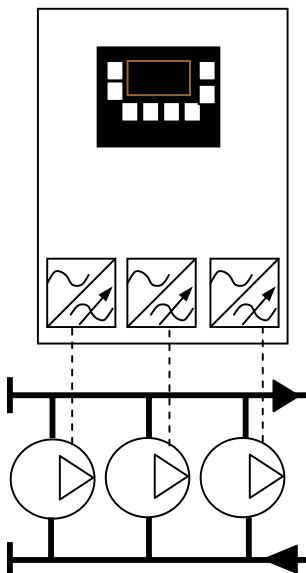

The control variations are listed below:

Systems with variable-speed pumps

Series **GVS** (Serial)

Each pump is controlled by a frequency converter.

Only example for GVS300...

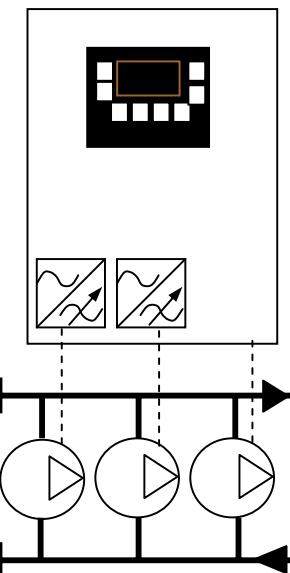

Constant pressure through continuous adjustment of the pump speed. The operating pumps can turn at the same speed (Synchro) or, by means of the programming menu, it is possible to choose serial control where the pumps which start up in cascade modulate the speed, letting the previous ones turn at max speed (50 Hz).

Systems with variable-speed and fixed-speed pumps

Series **GVM** (Mix)

Two pumps are each controlled by a frequency converter; the third pump runs at fixed speed. Operation at variable speed is provided only by the pumps controlled by an inverter.

Only example for GVM210...

Constant pressure through continuous adjustment of the speed of the pumps controlled by frequency converters. For this solution it is also possible to choose Synchro or Cascade Serial mode.

ELECTRIC CONTROL PANEL AND SD60 CONTROL UNIT

Electric panel or the supply, control and protection of, at most, six three-phase electric pumps, with sheet steel case (fig. 1) and protection rating IP55.

Main characteristics:

- Main door-blocking switch, fuse carrier and fuses, starting contactors and thermal protection.
- Standard supply voltage: 3x400Vac +/-10%, 50/60Hz.
Non standard voltages on request, 1x230Vac +/-10%, 3x230Vca +/-10%, 50/60Hz.
- Transformer for low voltage auxiliary circuit; auxiliary voltage 24Vac.
- Inside, depending on the type of control variation, one or more frequency converters.

Lowara SD60 digital control unit, with microprocessors, with graphic display and programming keys (see fig. 2).

The SD60 is a programmable electronic controller with high connectivity and flexibility for regulating and monitoring variable-speed pressure boosting sets. The unit is based on a powerful platform that includes hardware able to satisfy the requests on the market and software which, thanks to the STRATON®, development environment, makes it possible to develop applications using standard programming languages, such as PLC. The controller offers the following characteristics and functions:

- Graphic display type o-led 2,7". The graphic display can show the state of the system, of the individual pump, the alarms log, one or more alarms in progress, the state of the digital inputs and outputs, the value of the analog inputs and outputs, the running hours of each pump installed or other elements depending on the menu. The system service technician can therefore obtain, at any time and with a few simple moves of the menu, a summary of the state of the applications, to decide what maintenance is needed.
- Multi-language.
- Indicating leds: automatic/manual operating mode (ref. 1), line presence (ref. 2), general fault (ref. 3), alarm level for water lack on suction side (ref. 4), pump running (ref. 5).
- Programming and menu browsing touch keys, type cap – sense back-lit.
- Manual adjustment of the output frequency, at the motor, of each inverter (jog mode).
- Manual starting of each fixed-speed pump.
- Management of a jockey pump and of a standby pump.
- Management of up to a maximum of six working set points.
- Management of frequency converter operation.
- Timing on starting and stopping of each installed pump.
- Cyclical exchange of starting of the variable-speed pump and of the fixed-speed pumps, to guarantee uniform wear of all the installed pumps.
- Four (4) analog inputs in current 0(4)-20mA for the connection of electronic sensors (pressure, flow rate, level, temperature, ...).
- One (1) analog input in current 0(4)-20mA and one (1) output in voltage 0(2)-10Vdc. The functions of the analog outputs are programmable.
- Dedicated inputs for the connection of the low level control device, low pressure on suction side of the pump set. The device may be chosen from: minimum pressure switch, float, three electric probes.
- Digital relay outputs for pump control.
- One (1) dedicated digital relay output, with two exchanging contacts, programmable type. Depending on the devices connected, there may be the following alarm signals: low level on suction side, motor overload, faulty sensor, faulty inverter, maximum and minimum pressure on pump set delivery side, fault due to general external device (excess voltage, insufficient voltage of power supply line, ...).

fig. 1

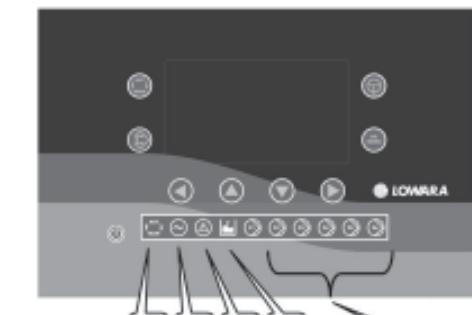

fig. 2

a xylem brand

ELECTRIC CONTROL PANEL AND SD60 CONTROL UNIT

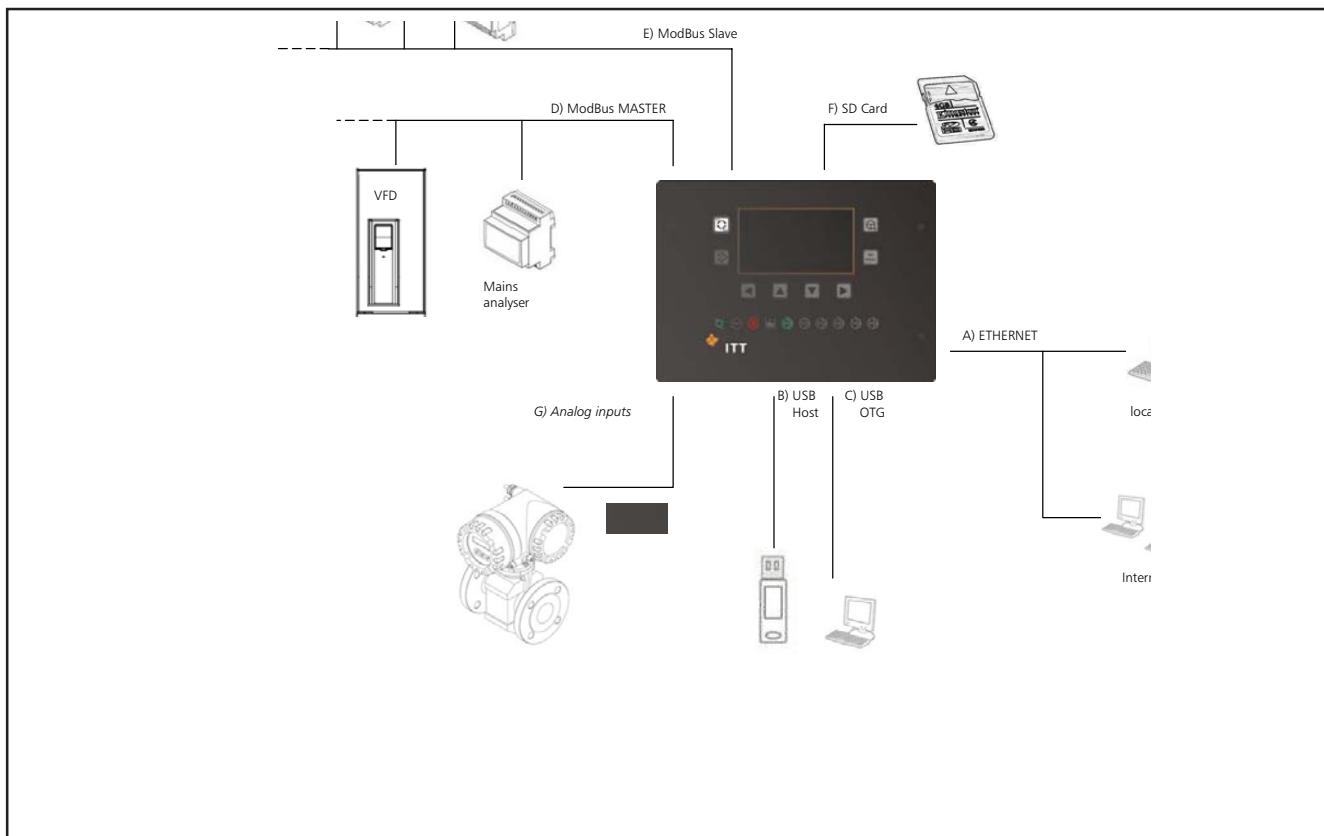

- One (1) dedicated digital relay output, with two exchanging contacts, programmable. Depending on the devices connected, there may be the following signals: set running, inverter running, autotest in progress.
- Dedicated optoisolated digital inputs for the connection of the running pump contacts, thermal protection.
- Optoisolated digital inputs, programmable according to the type of protection and control devices connected (PTC, maximum pressure switch, external alarm, faulty inverter, remote consent, change set point, ...).
- Thanks to the large capacity of the flash memory and to the clock with RCT buffer battery, it is possible to memorise all the alarms that occur, the value of the main physical characteristics regulated (pressure, flow rate, ...) and the state of the installed pumps. The data can be transferred to USB stick or to a PC, also by means of USB ports or ETHERNET. Two high-performance 16 bit microprocessors guarantee high speed of execution of the program and efficient interface management. All the important parameters are password-protected.

- Compatibility with supervision and control systems is becoming more and more important. For this reason the SD60 unit is equipped as standard with two (2) optoisolated serial interfaces, for connection with the most widespread BMS supervision and control systems or with applications developed by third parties. Standard communication protocols are of the ModBus RTU.

It is also possible to interface with other supervision systems that use other communication protocols (BacNet™, Johnson Metasys®, TCP/IP, LonWorks®, Trend..) by means of optional external modules, available on request.

- Thanks to the web server and to the P_LAN gateway, it is possible to interface with intranet/internet networks.
- Slot for inserting memory card Micro SD card Max 2 Giga. Secure Digital (referred to briefly as SD) is the most widespread form of memory card, electronic devices used to store large quantities of information in digital format in flash memories. The user can therefore choose to save the event log data in the memory card (not included) instead of in the flash ram of the SD60 unit.
- One (1) USB port, Host type, for connecting devices such as a USB stick (also known as USB flash drive, USB pen, pendrive...): it is possible to transfer data such as the configuration files of the SD60 unit, the events log ("csv" format) or to import files such as software updates.
- One (1) USB OTG port for displaying, exporting (saving on PC) configuration files and the events log and for importing (saving on SD60) the configuration file, software updates.
- To guarantee greater safety and more simple maintenance of the pressure boosting systems, the SD60 unit can be provided with a serial connection to the electronic mains analysing module. This module allows monitoring of all the electric values of the pump set electric supply line, including energy consumed. The data can be exported in a file.
- Provision for connection with an optional module with 5 digital outputs, each one programmable, each with final electric contact of the type NO normally open (on request, module with electric contact NC). Signals available: Automatic/Manual system mode, pump no. running, Thermal protection tripped pump no., low level/minimum pressure alarm on suction side of set, maximum and minimum pressure alarm on delivery side of set, external alarm, autotest failed, line presence, inverter running.

CONNECTIONS OF SD60 CONTROL UNIT

Key:

- A) LAN port, Ethernet 10 100 integrated in the board, connector RJ45. It is possible to configure, display and control on a PC the state of operation of the pump set in a local Intranet network or even on the Internet, if accesses are enabled. The SD60 unit has as a standard feature (the Web server application) which allows a computer to be connected by Ethernet to the SD60 unit. It is therefore possible to export the user interface from the SD60 unit to a PC to allow external monitoring and control of the unit and, consequently, of the system.
- B) USB port, Host type. It is possible to connect only devices such as a USB stick (also called USB flash drive, USB PEN, pendrive) to this port. With this device it is possible to export files such as the configuration file of the SD60 unit, the events log ("csv" format) or to import files such as software updates.
- C) USB OTG port for connection to PC. With this device it is possible to display, export files (save on PC), such as the configuration file of the SD60 unit, the events log ("csv" format) or to import files such as software updates.
- D) ModBus Serial port, Master type on hardware RS485. The serial interface is for communication between the SD60 controller and the inverters of the pump set, the mains analyser and, if present, expansion modules such as the module for boosting dry digital contacts. Standard communication protocol type ModBus RTU with possibility of setting the following parameters by software: BAUD RATE, PARITY CONTROL, STOP BIT.
- E) ModBus Serial port, Slave type on hardware RS485. The serial interface is for communication between the SD60 controller and the supervision systems. Standard communication protocol type ModBus RTU with possibility of setting the following parameters by software: ADDRESS, BAUD RATE, PARITY CONTROL, STOP BIT.
- F) The SD60 unit is equipped, as hardware, with a slot for inserting the memory card Micro SD card Max 2 GB. Secure Digital (referred to briefly as SD) is the most widespread form of memory card, electronic devices used to store large quantities of information in digital format in flash memories. The user can therefore choose to save event log data in the memory card (not included) instead of in the flash ram of the SD60 unit.
- G) Standard features, four configurable analog inputs. Standard, two inputs exclusively for connection to pressure sensors, one active and one in standby with automatic activation in the event of malfunction of the main sensor. Devices may be connected to the remaining inputs such as a flow rate meter, thermal probes for temperature control, an additional pressure sensor.

ENERGY SAVING

The worldwide demand for energy is growing all the time and, while the demand is increasing, production is coming up against serious problems of an environmental nature and related to the supply of raw materials. In other words, energy is an asset that is becoming more precious every day, imposing choices to optimise consumption, especially with a view to safeguarding the environment.

A very important improvement role is played by new technologies which include, among the most desirable parameters, environmental protection and energy saving as well as best technical performance. Drives for electric motors fall into this category. As well as making a considerable contribution to the decrease in energy consumption and consequently to the improvement of the environment, in many applications they also produce a notable reduction in the overall costs of running the installations.

Drives for Electric Motors

The electronic drives that are most involved in the general improvement of the quality of systems and installations, are those for asynchronous alternating current motors, generally three-phase induction motors. They may be divided into two large categories:

- Drives with variable voltage
- Drives with variable frequency

The first, called "starters" or "soft starters", are appliances that operate at constant frequency (that of the power mains), dose the voltage supplied to the load and have limited current.

The following figure illustrates the typical operation of the "soft starter":

The second, called "Inverters" or "frequency converters" are most important from the point of view of energy saving and are able to supply the motor with a practically sinusoidal current (PMW) at a frequency that may vary from a value of practically 0 Hz to a rated frequency and beyond, with a constant flow (torque) or constant power. Typical example, fig.2:

The applicatory advantages of the two categories of drives will be described below.

Softstart

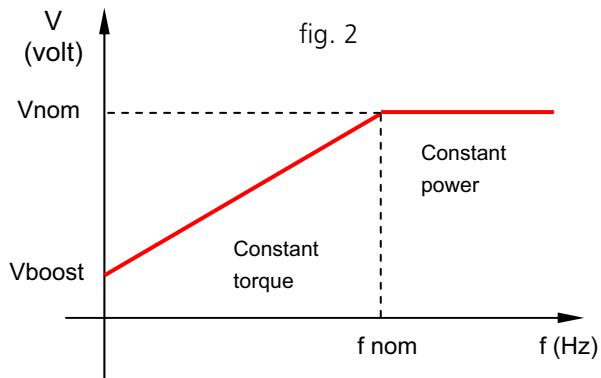

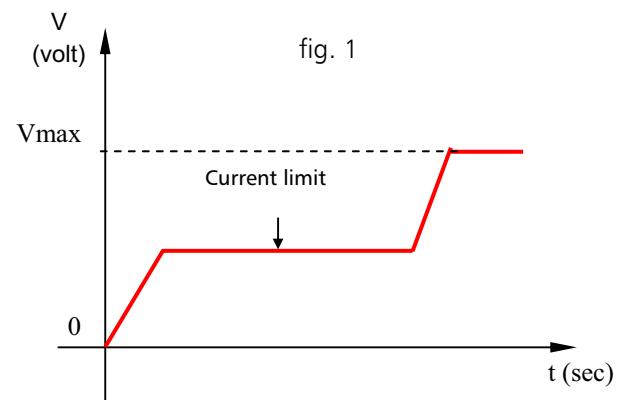

The direct starting of an asynchronous motor presents considerable difficulties due to the peak current in the start phase. Typically the value of the starting current is about 7/8 times the rated current of the motor.

Direct start systems are therefore not generally convenient (except for small power); mainly because of the need to increase the size of the power supply mains (switches, fuses, etc. ...), and also problems of a mechanical nature, due to high stress in the start phase which in the medium/long term may prove to be destructive.

The electrical engineering industry has already found various practical solutions to the problems; the main ones are noted below:

- Special motors with double winding
- Starting with autotransformer
- Star/delta starting

These starting systems are certainly an improvement on direct starting, but they do not solve the problem. The advent of electronic starters ("soft starters") made a decisive contribution to solving the question.

ENERGY SAVING

This type of drive is able to supply performance advantages:

- Progressive start with a voltage ramp having a duration adjustable within wide time limits.
- Limited current start with a value that can be set from 100% to 500% of the rated value.
- Descending voltage ramp having a duration adjustable within wide time limits.
- Voltage ramps at starting and stopping adaptable to particular operations (pumps).
- Low-speed operation, with reversible running direction, for specific applications.
- "Energy Saving" function with automatic reduction of the voltage/current in the case of a prolonged underload.
- Safety devices that can be calibrated to prevent overheating of the motor, over/under currents and over/under voltages.
- Safety devices that can be calibrated to prevent prolonged or too frequent starts.
- Possibility of by-pass operation after starting, keeping all the safety devices active.

All these features make the electronic starter the ideal tool for solving the problems we have mentioned. With the recently designed starters, with both analog and digital control, it is possible to obtain considerable softer and more efficient starts than any other electromechanical system was able to achieve. Moreover, thanks to the intrinsic control and protection systems of the starter, it is generally possible to eliminate other protection equipment that would otherwise be necessary in the system.

In conclusion, in many applications, one can SAVE on:

- Structure and auxiliary equipment of the power supply system.
- Protection of the mechanical system against excessive stress.

Speed Adjustment

The speed adjustment systems allow energy consumption in proportion to the use of the system based on user demand. This allows considerable savings in systems working on a daily basis (24h).

Alongside applications that require operation of the electric motors at a constant speed, with steady voltage and frequency, there are many in which the electric motor must be able to vary its speed of rotation (frequency); moreover, in many applications the process control obtained by varying the speed (adjustment of flow rate, pressure, etc...) is much more convenient than any other method of adjustment.

For these applications the most suitable drives are certainly frequency converters, referred to below as "Inverters", which can supply the motor with the desired torque from a few rpm up to the rated speed beyond which they are still able to operate at constant power with a decreasing torque. The advantage of using the Inverter lies in the greater efficiency of the performance that it is able to give in comparison with electromechanical controls.

A useful application of frequency converters may simply be that of obtaining a soft start for a load that is particularly heavy to start (pump) and variable over time (flow rate). In any case the advantage of a soft start is present in all inverter-controlled systems for starting a motor, even in cases where speed adjustment is not needed.

The advantage is due to the fact that the inverter is able to supply the rated torque (with possibility of 150% overload with respect to the rated current), right from frequency zero. This is possible because the voltage to the motor, generated by the inverter, is in phase with the number of revolutions right from the start (unless the motor is running). In this way the losses in the motor are considerably reduced.

The starting torque that can be obtained using the inverter is greater than that obtained with a soft starter, and the demand for current in the whole starting phase is much lower.

The yearly saving, for a lost power of 40000 Kwh, with electromechanical start, may be as much as 2000 Euro.

The reliability and efficiency of the pump speed control systems means optimising consumption and processes as well as savings. In the specific case of pumping appliances, the immediate consequence of the use of these systems is the realisation of pumps with greater operative flexibility, with much larger and optimal performance curves. There are many advantages – above all, a pump that always works, irrespective of variations in the installation, in optimal conditions with less wear and less malfunctions. So there are less problems from downtime and the pumps require less frequent maintenance. Moreover, an installation where the pumps are controlled by an inverter is more efficient and less subject to stress:

- absence of water hammer (which occurs when switching off pumps driven in a traditional way);
- lower working pressures than systems with an autoclave or piezometric tank;
- pressure and flow rate conditions always adequate for the demands, because the inverter is able to adjust the pump gradually in real time according to the pressure trend in the installation.

ENERGY SAVING

All this results in less stress on all the components in the distribution network, and therefore in less maintenance of the network, greater reliability of supply and lower running costs.

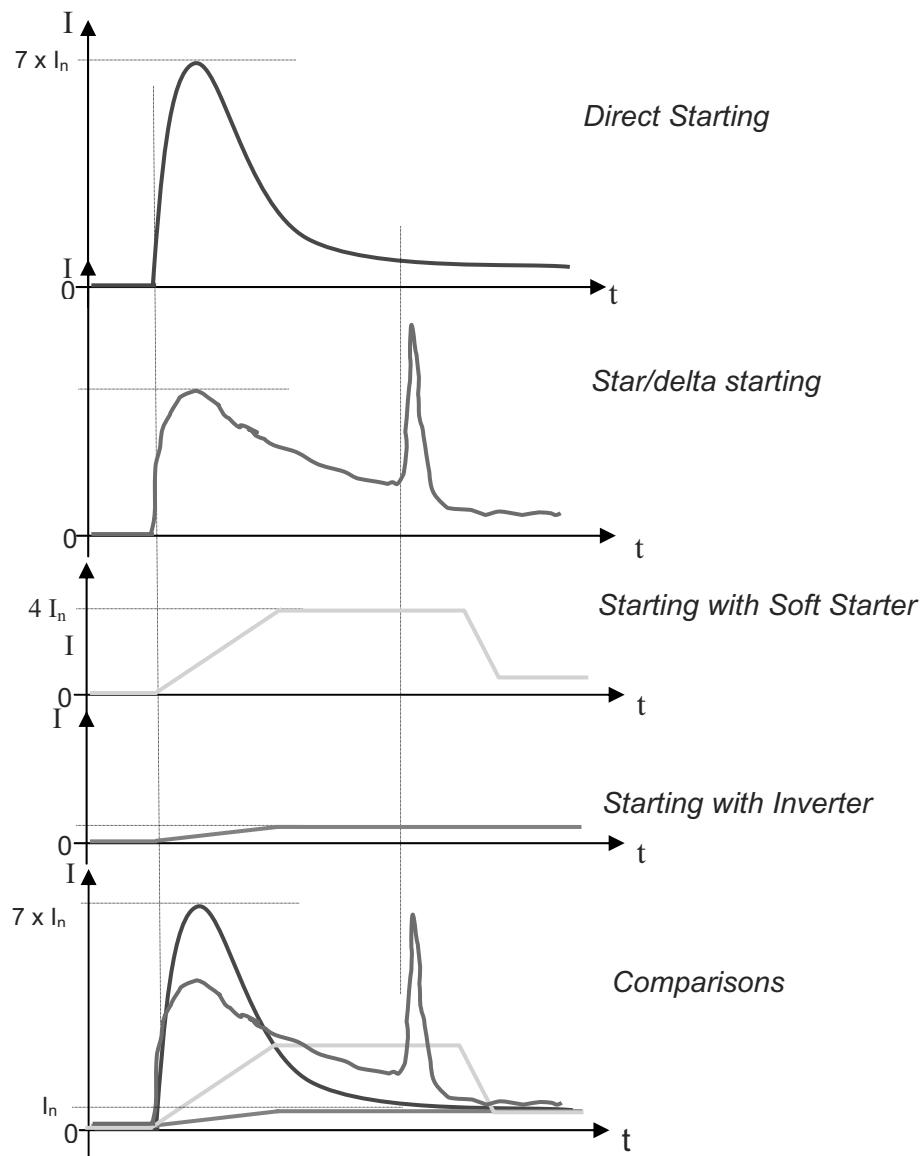

In short, using a pumping system with one or more variable-speed pumps means:

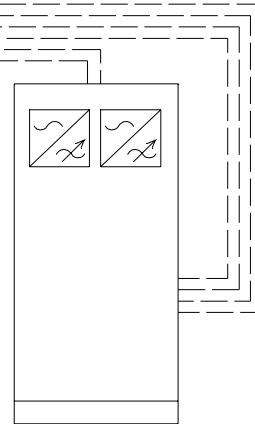

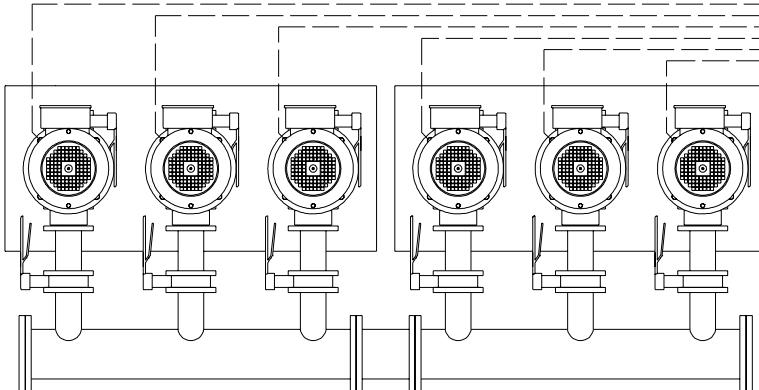

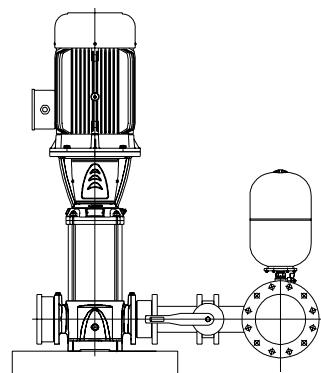

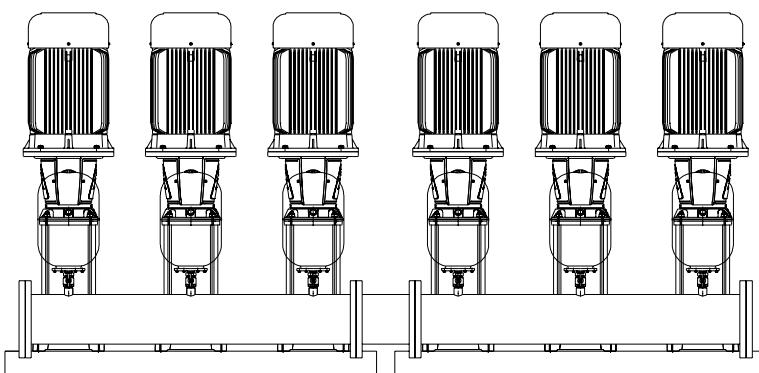

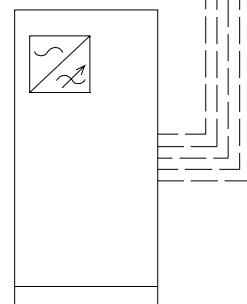

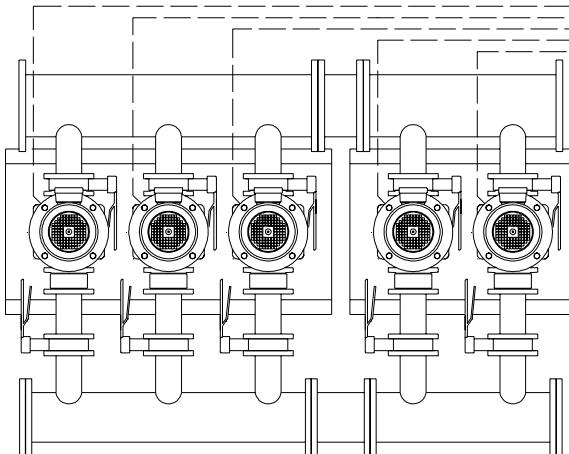

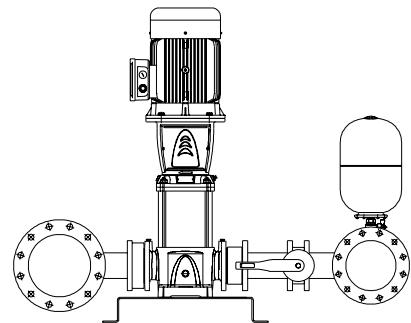

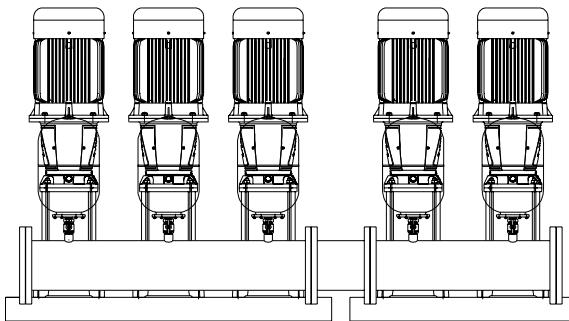

- ✓ Saving energy;
- ✓ Optimising resources and processes;
- ✓ Having the possibility of complete integration of the management, control and supervision systems;
- ✓ Prolonging the life of the installations;
- ✓ Reducing maintenance costs;

Increasing the productivity and efficiency of an installation.

Comparison of starting systems

Having examined the various starting systems that can be realised for electric motors, direct start, star/delta, soft starter and inverter, they can be compared, analysing the absorbed currents and therefore the energy consumed (current = energy = kWh = MONEY)

**GVF-GVM SERIES
SPECIAL VERSIONS WITH 5/6 PUMPS**

GVF_SPEC-SV_C_DD

GVF140D0/92SV3G220T
GVM240Y0/92SV5/2AG70T/SCA

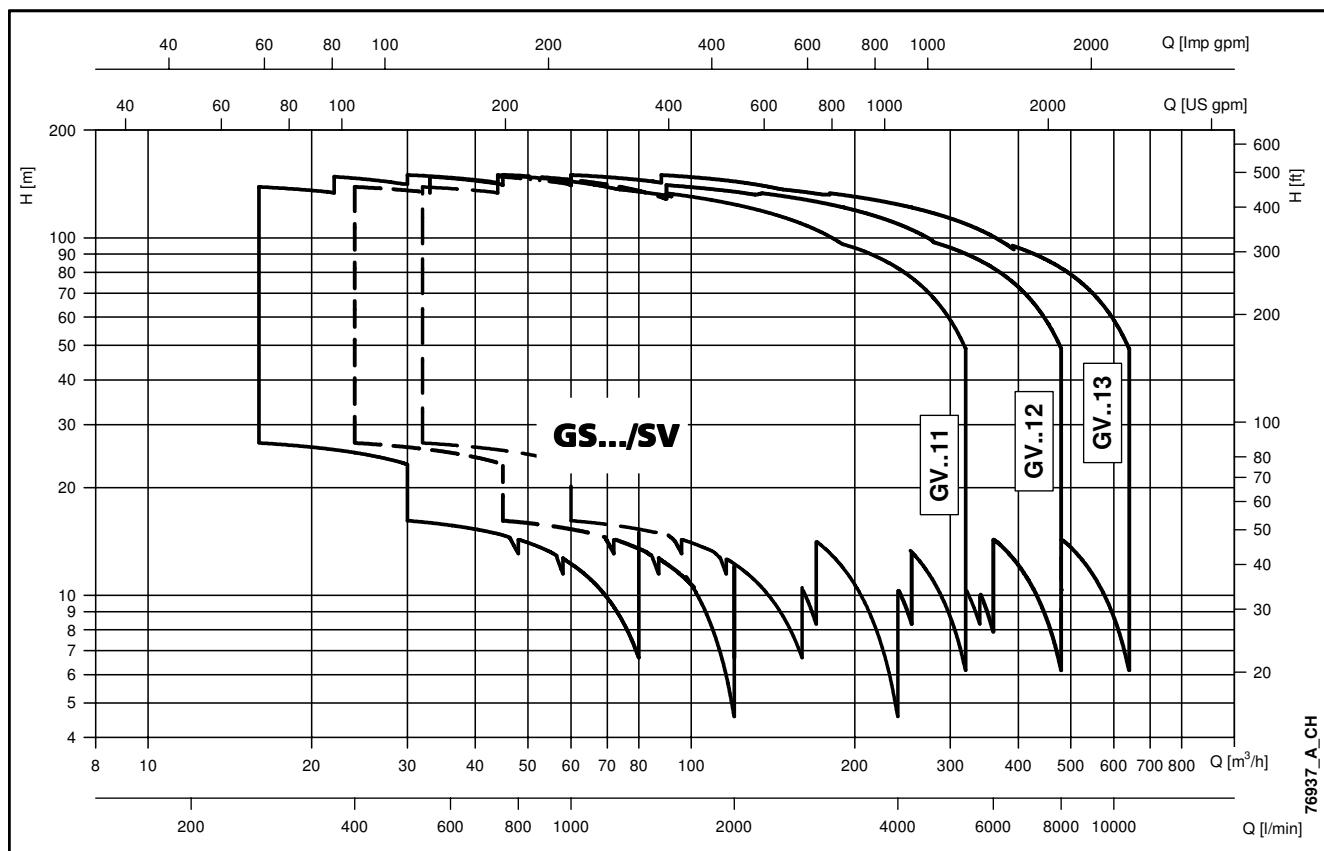

N.B.: Please request other special versions with regard to materials used, working temperatures, electric panels with additional functions.

GVF.../SV Series

Variable-speed booster sets with e-SV™ series
Vertical Multistage Electric Pumps with
high-efficiency motors and
flow rates up to 640 m³/h

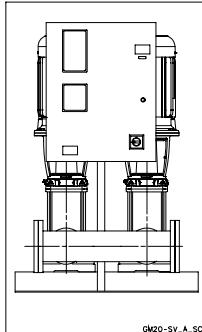

50 Hz

GV.../SV SERIES HYDRAULIC PERFORMANCE RANGE AT 50 Hz

RANGE

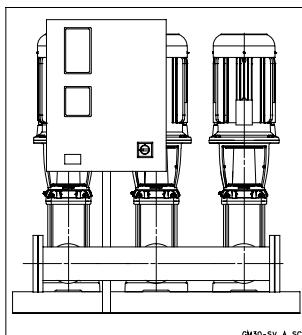

The range of GVF series variable-speed booster sets includes models with 2 to 4 electric duty pumps to adapt to the specific needs of each application.

GVF.../SV

GVF11 SETS

- Variable-speed sets with two multistage vertical service pumps, SV series, with power ratings up to 37 kW.

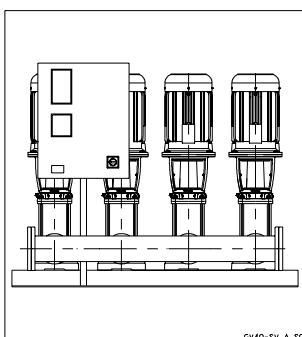

Head up to 160m.
Flow rate up to 320 m³/h.

GVF12 SETS

- Variable-speed sets with three multistage vertical service pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 480 m³/h.

GVF13 SETS

- Variable-speed sets with four multistage vertical service pumps, SV series, with power ratings up to 37 kW.

Head up to 160m.
Flow rate up to 640 m³/h.

REFERENCE STANDARDS

- The Lowara booster sets are CE-marked for conformity with the following directives:
 - Machinery Directive: 2006/42/EC.
 - Low Voltage Directive 2006/95/EC.
 - Electromagnetic Compatibility Directive 2004/108/EC
- Electric pump performance complies with the following standard:
ISO 9906-A Rotodynamic pumps – hydraulic performance acceptance tests.

CHARACTERISTICS OF THE ELECTRIC PUMPS

The SV pump is a multistage vertical pump, not self-priming, combined with a normalised standard motor. The hydraulic part is kept in place between the upper cover and the pump body with tie-rods. The pump body is available in different configurations and connection typologies.

Technical Information:

Flow rates: up to 160 m³/h.

Heads: up to 160 m.

Temperature of pumped liquid:

- from -30°C to +120°C for 15, 22, 33, 46, 66, 92, 125SV standard version.

Tested to ISO 9906 annex A.

Clockwise direction of rotation looking at the pump from above (indicated with an arrow on the bracket and joint).

Motor

Short circuit squirrel cage motor, totally enclosed, fan-cooled. Standard supplied IE2/IE3 motors are compliant with Regulation (EC) no. 640/2009 and IEC 60034-30.

IP55 protection.

Class 155 (F) insulation.

Performance levels according to EN 60034-1.

Standard voltage:

Single-phase version: 220-240 V, 50 Hz.

Three-phase version: 220-240/380-415 V, 50 Hz for power up to 3 kW,
380-415/660-690 V, 50 Hz for power above 3 kW.

For electrical data of the motors used see Technical Appendix.

Materials

Suitable for pumping drinking water (WRAS certified).

CHARACTERISTICS OF THE ELECTRIC PUMPS USED IN GV SERIES BOOSTER SETS

CHARACTERISTICS OF 15, 22SV SERIES

- Vertical multistage centrifugal pump. All metal parts in contact with the pumped liquid are made of stainless steel.
- The following versions are available:
 - **F**: round flanges, in-line delivery and suction ports, AISI 304.
 - **T**: oval flanges, in-line delivery and suction ports, AISI 304.
 - **R**: round flanges, delivery port above the suction port, with four adjustable positions, AISI 304.
 - **N**: round flanges, in-line delivery and suction ports, AISI 316.
 - **V, P**: Victaulic® couplings, in-line delivery and suction ports, AISI 316.
 - **C**: Clamp couplings (DIN 32676), in-line delivery and suction ports, AISI 316.
 - **K**: threaded couplings, (DIN 11851), in-line delivery and suction ports, AISI 316.
- Reduced axial thrusts enable the use of **standard motors** that are easily found in the market.
Standard supplied IE2/IE3 three-phase surface motors ≥ 0,75 kW are compliant with Regulation (EC) no. 640/2009.
- Mechanical seal according to EN 12756 (ex DIN 24960) and ISO 3069 for 1, 3, 5SV and 10, 15, 22SV (\leq of 4 kW) series.
- **Balanced mechanical seal** according to EN 12756 (ex DIN 24960) and ISO 3069, which **can be replaced without removing the motor from the pump** for 10, 15 and 22SV (\geq of 5,5 kW) series.
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- A second plug is available for 10, 15, 22SV series.
- Versions with round flanges that can be coupled to counter-flanges, according to EN 1092.
- Threaded, oval counter-flanges made of stainless steel are standard supply for the T versions.
- Round counter-flanges made of stainless steel are available on request for the F, R and N versions.
- Easy maintenance. No special tools required for assembly or disassembly.
- **The pumps for F, T, R, N versions are certified for drinking water use (WRAS and ACS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.

GVF.../SV

CHARACTERISTICS OF 33, 46, 66, 92, 125SV SERIES

- The following versions are available:
 - **G**: vertical multistage centrifugal pump with impellers, diffusers and outer sleeve made entirely of stainless steel, and with pump casing and motor adaptor made of cast iron.
 - **N, P**: version made entirely of AISI 316 stainless steel.
- Innovative axial load compensation system on pumps with higher head. This ensures reduced axial thrusts and enables the use of **standard motors** that are easily found in the market. **Standard supplied IE2/IE3 three-phase surface motors are compliant with Regulation (EC) no. 640/2009.**
- **Balanced mechanical seal** according to EN 12756 (ex DIN 24960) and ISO 3069, which **can be replaced without removing the motor from the pump**.
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- **The pumps for G, N versions are certified for drinking water use (WRAS and ACS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.
- Pump body fitted with couplings for installing pressure gauges on both suction and delivery flanges.
- In-line ports with round flanges that can be coupled to counter-flanges, in compliance with EN 1092.
- Mechanical sturdiness and easy maintenance. No special tools required for assembly or disassembly.

OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature	Above -10°C a + 80 °C
Ambient temperature	Above 0°C a + 40 °C
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar in function of pump type
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Hourly starts (single pump)	0,37 kW ≤ Pn ≤ 3 kW max 60 starts per hour. Direct motor start; 4 kW ≤ Pn ≤ kW max 40 starts per hour. Direct motor start; 11 kW ≤ Pn ≤ kW max 30 starts per hour. Direct motor start; 18,5 kW ≤ Pn ≤ 22 kW max 24 starts per hour. Direct motor start; 30 kW ≤ Pn ≤ 37 kW max 16 starts per hour. Start/delta start; Pn = 45 kW max 8 starts per hour. Start/delta start;
Sound emission	See table

* On request, PN above in function of the pump

GVcom_2p-en_a_tr

** Noise value of the electric motor only.

MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling up to 2" size included. Butterfly type for installation between the flanges are used for larger diameters.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling up to 1"1/2 size, as well as the double-swing type to fit between the flanges.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (GV.RA series).
- **Suction manifold** made of galvanized or AISI 304 stainless steel with threaded or flanged ends depending on the type of pump (see drawings). Threaded coupling for water charging.
- **Delivery manifold** made of galvanized or AISI 304 stainless steel depending on the version, with threaded or flanged ends depending on the type of pump (see drawings). Fitted with two R1" threaded couplings with caps to allow connection of 24 or 20-litre diaphragm pressure vessels.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets:
 - in painted steel for sets with electric pumps series 15-22-33-46-66-92-125SV;
- **Electric control panel**, IP55 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION For general applications

Sets with 15-22SV pumps:

Nickel-plated brass valves, non-return valves with stainless steel flaps.

Sets with 33-46-66-92-125SV pumps:

Valves with polyamide butterfly, non-return valves with stainless steel flaps.

DW VERSION (GV./DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.

Sets with 15-22SV pumps:

Nickel-plated brass valves, non-return valves with stainless steel flaps.

Sets with 33-46-66-92-125SV pumps:

Valves with epoxy butterfly, non-return valves with stainless steel flaps.

AISI304 Version (GV./A304),

AISI 316 (GS./A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring a 24 or 20-litre diaphragm expansion vessel** with ball valve (one for each pump), in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 16 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit**;
- **Air feeder** for RA version;
- **Air compressor** for RA version.

SPECIAL VERSIONS AVAILABLE ON REQUEST

(Contact the Sales and technical Assistance Service)

- Units with non-standard input voltages, such as three-phase 3x230V, 3x440V.
- Units with single-phase input voltages 1x230V.
- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.
- Sets with 5 electric pumps.
- Sets with 6 electric pumps.
- Sets with jockey pump.

Booster sets

GVF11..D GVF11..R Series

MARKET SECTORS

CIVIL, INDUSTRIAL

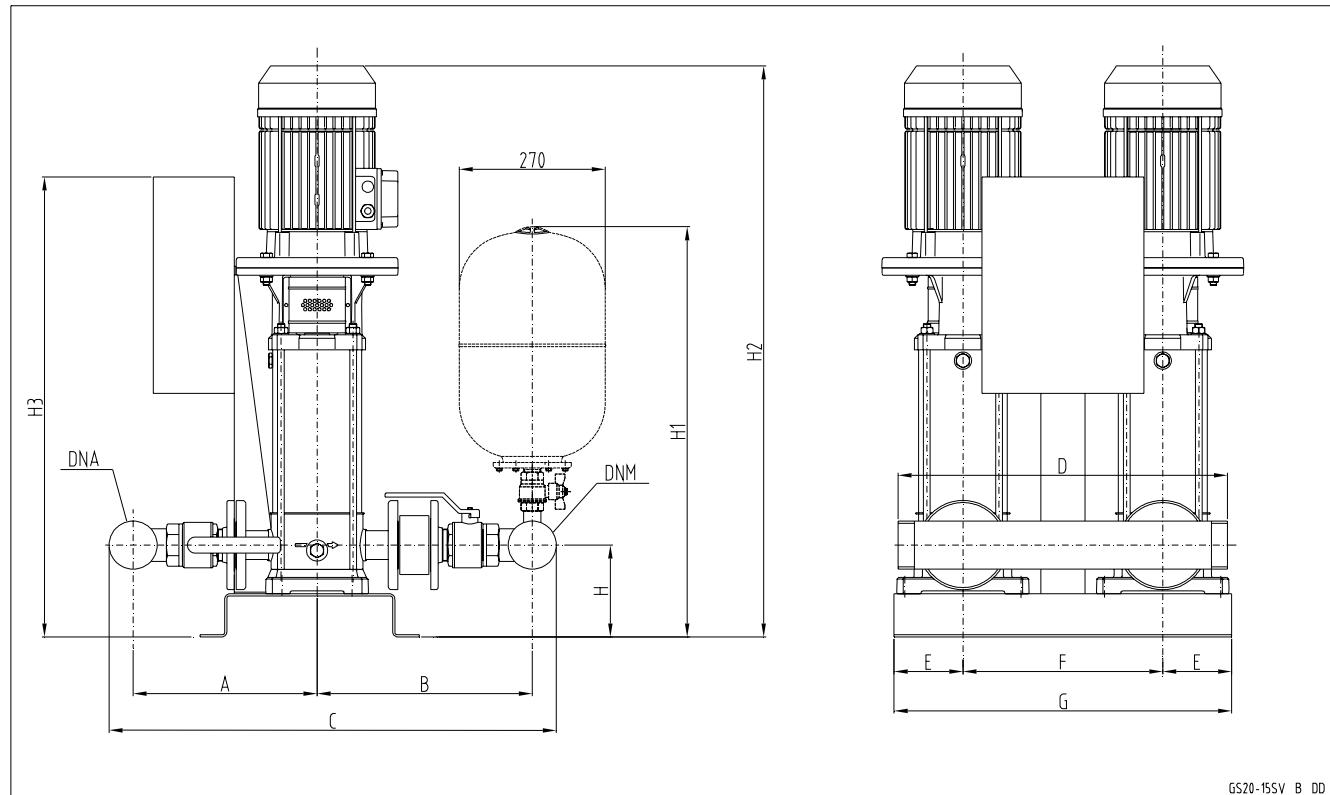

APPLICATIONS

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

GVF11D
GVF11Y

SPECIFICATIONS

- **Flow rate** up to 320 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 2 x 37 kW.
- Starting fixed-speed motors:
 - Direct for powers up to 22 kW inclusive for pump (GVF..D).
 - Star/Delta on request (GVF..Y set).
 - Softstarter, for higher powers (GVF..R set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
 - Maximum operating pressure: 16 bar.
 - Maximum temperature of pumped liquid : +80°C.

**TWO-PUMP BOOSTER SETS, GVF11 SERIES
VERTICAL ELECTRIC PUMPS WITH NON-RETURN VALVE
ON DISCHARGE SIDE**

MARKET SECTORS

CIVIL, INDUSTRIAL

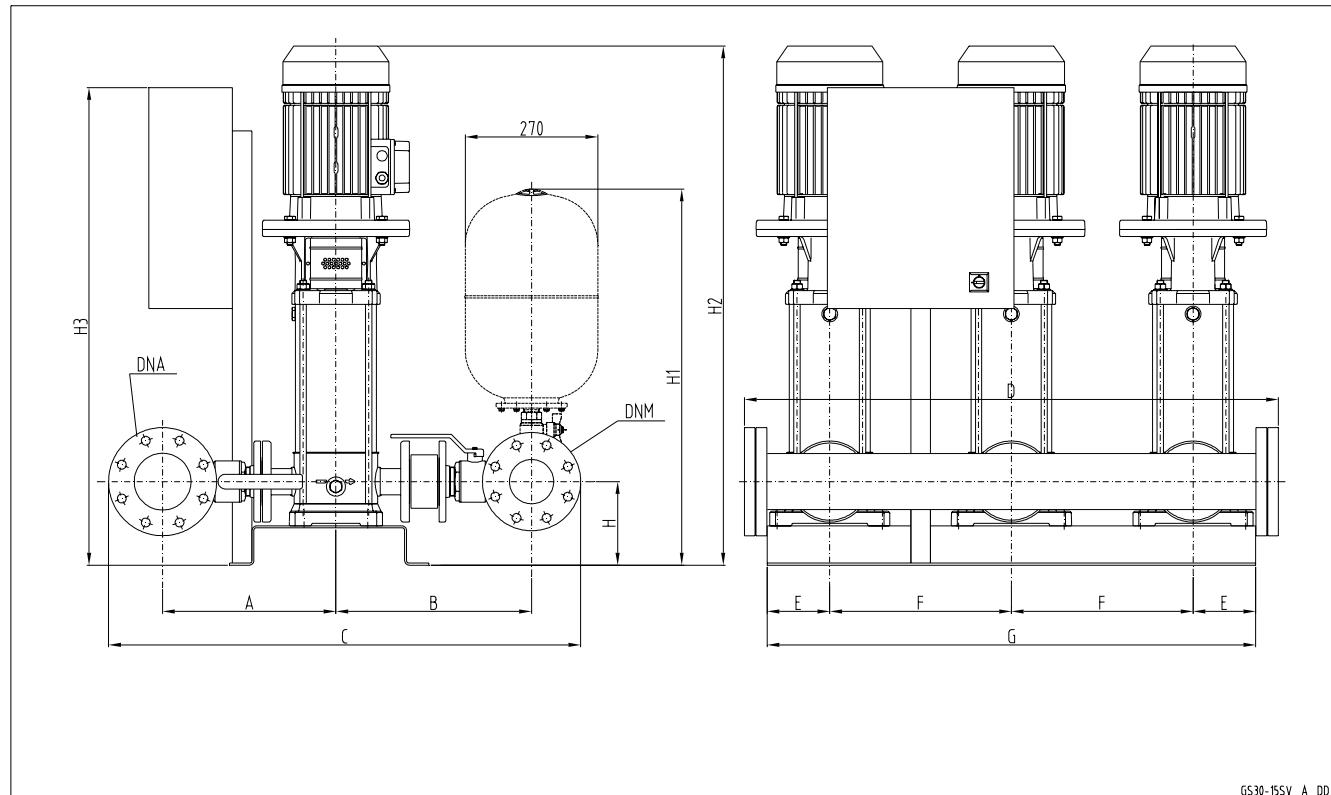

APPLICATIONS

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

SPECIFICATIONS

- **Flow rate** up to 480 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 3 x 37 kW.
- Starting fixed-speed motors:
 - Direct for powers up to 22 kW inclusive for pump (GVF..D).
 - Star/Delta on request (GVF..Y set).
 - Softstarter, for higher powers (GVF..R set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
 - Maximum operating pressure: 16 bar.
 - Maximum temperature of pumped liquid : +80°C.

MARKET SECTORS

CIVIL, INDUSTRIAL

APPLICATIONS

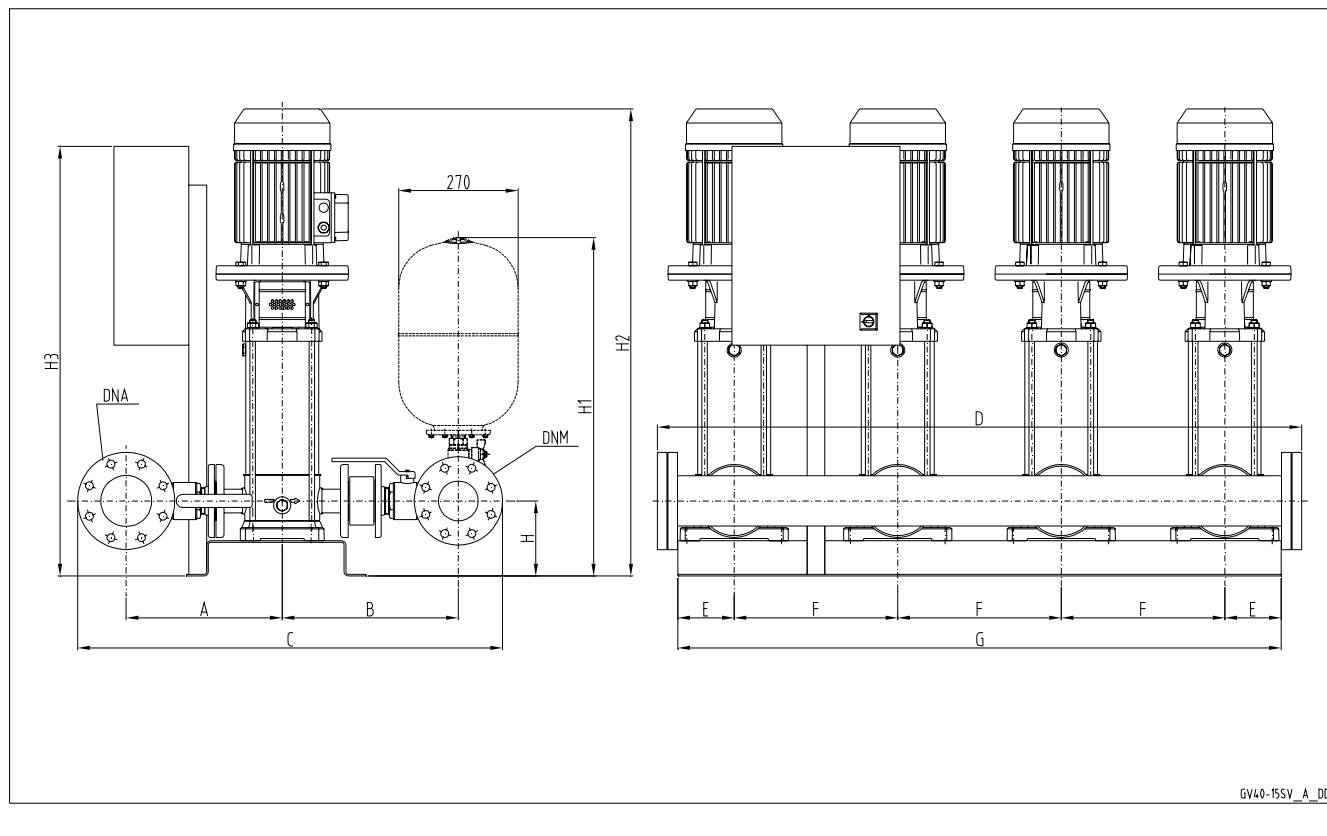

- Water network supply in condominiums, offices, hotels, shopping centres, factories.
- Water supply to agricultural water networks (e.g. irrigation).

GVF13D
GVF13Y

SPECIFICATIONS

- **Flow rate** up to 640 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency 50 Hz.
- Voltage for controls outside panel: 24 Vac.
- Electrical panel protection class IP 55.
- Maximum service pump power: 4 x 37 kW.
- Starting fixed-speed motors:
 - Direct for powers up to 22 kW inclusive for pump (GVF..D).
 - Star/Delta on request (GVF..Y set).
 - Softstarter, for higher powers (GVF..R set).
- **Electric pumps with vertical axis:**
 - SV series (motor protection class IP55).
 - Maximum operating pressure: 16 bar.
 - Maximum temperature of pumped liquid : +80°C.

**FOUR-PUMP BOOSTER SETS, GVF13 SERIES
VERTICAL ELECTRIC PUMPS WITH NON-RETURN VALVE
ON DISCHARGE SIDE**

BOOSTER SETS, GV.../SV SERIES OPERATING CHARACTERISTICS AT 50 Hz (SERVICE PUMP)

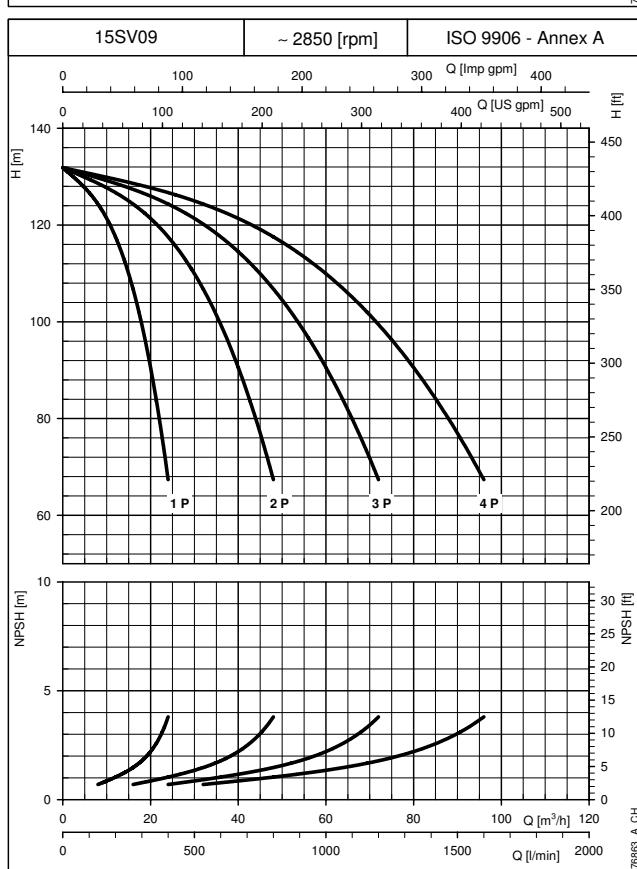

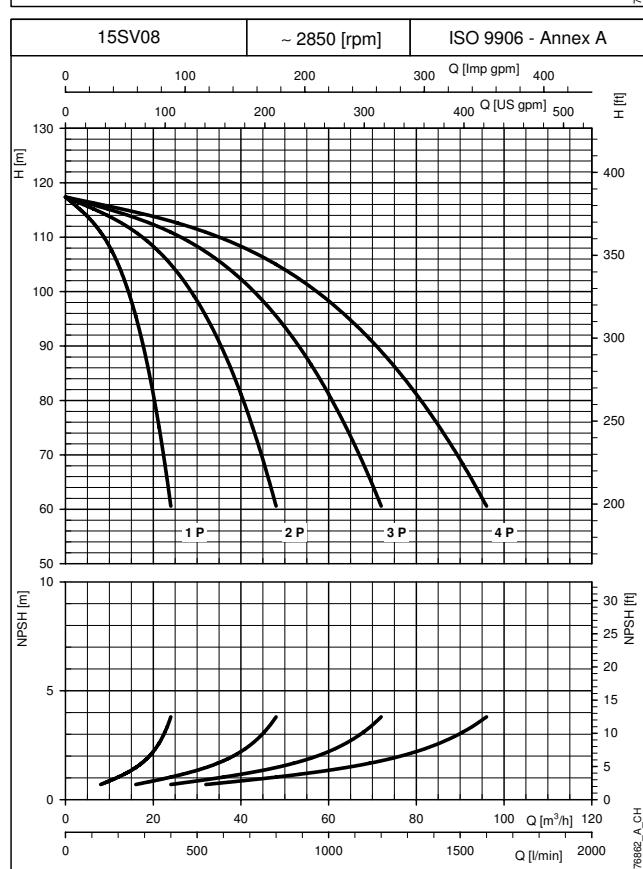

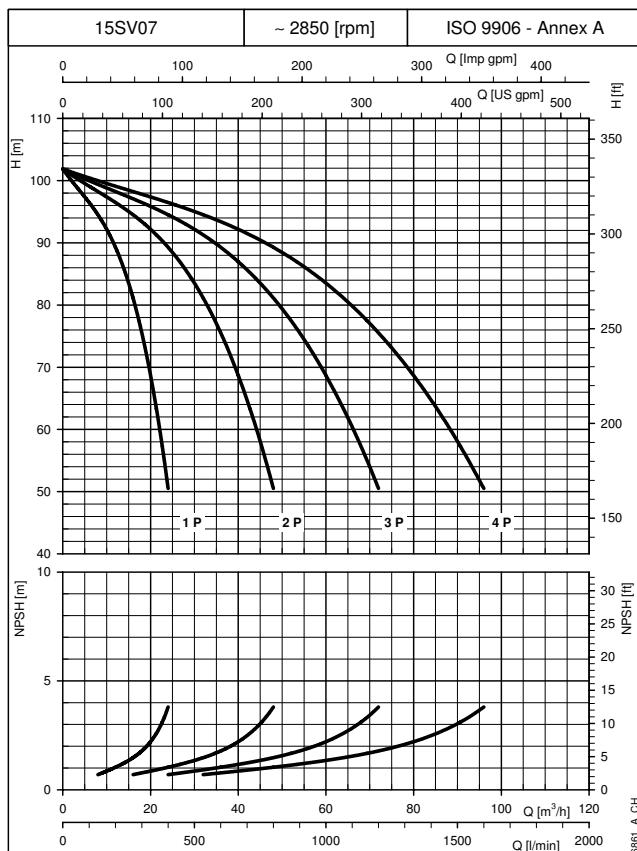

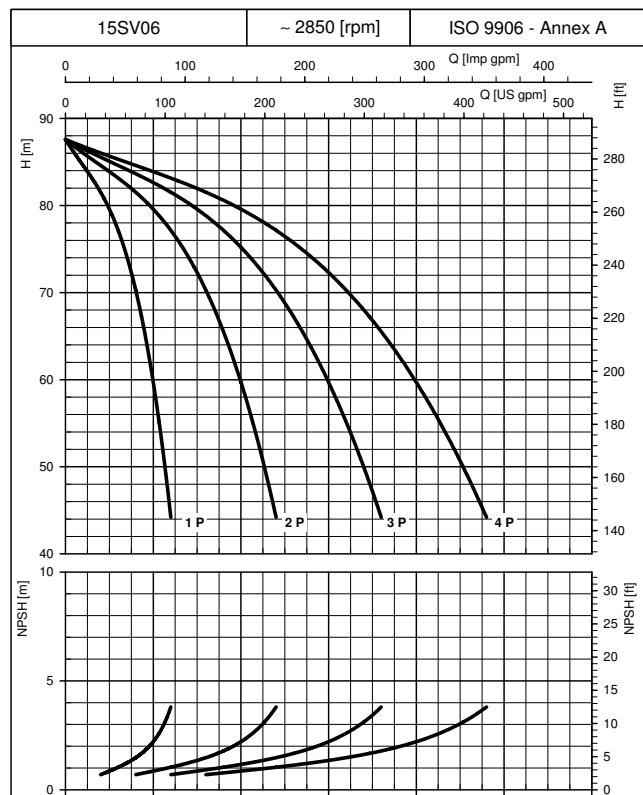

The performance curves do not take into account flow resistance in the valves and piping.

The curves show the performance with one, two, three and four pumps running.

These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{s}$.

The declared NPSH values are laboratory values: for practical use we recommend increasing these values by 0.5 m.

The performance curves do not take into account flow resistance in the valves and piping.

The curves show the performance with one, two, three and four pumps running.

These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{s}$.

The declared NPSH values are laboratory values: for practical use we recommend increasing these values by 0.5 m.

BOOSTER SETS, GV.../SV SERIES OPERATING CHARACTERISTICS AT 50 Hz (SERVICE PUMP)

ACCESSORIES

ACCESSORIES

DIAPHRAGM TANKS

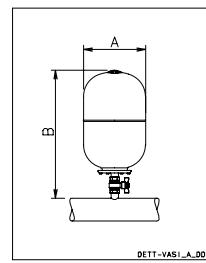

The booster sets are ready for installation, directly on the manifold, of 24-litre diaphragm tanks, one for each pump. The sets are also equipped with caps to close off the unused couplings. Larger tanks can also be connected to the unused end of the discharge manifold. For proper sizing of the tank please refer to the technical appendix.

Kits featuring the following accessories are **available on request**:

- diaphragm tank;
- on-off ball valve;
- operating instructions;
- packaging.

COUNTERFLANGE KIT

Manifolds up to 3" in diameter are usually supplied with threaded couplings and caps on unused end.

Counterflange coupling kits made of zinc-plated or stainless steel are available on request.

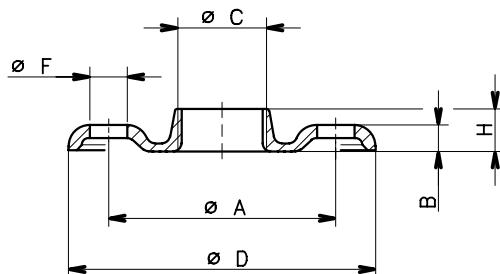

The counterflange kits are equipped with:

- threaded flange.
- gasket and bolts/screws.
- threaded counterflange (weld-on type for 3" diameter).

RUBBER EXPANSION JOINT KIT

The anti-vibrating joints or compensation joints can be used in order to absorb deformations, expansions, noises in the piping and to reduced ram blows. Moreover they can resist a high degree of empty that allows the absorption of negative expansions for depression.

Being of elastic material it can be become deformed and be dilated facilitating therefore the installation, that it becomes simpler and fast, also in which the piping they are not aligned. It does not need assembly joints.

DRY RUNNING PROTECTION SYSTEMS

Dry run shutdown systems should be installed to protect the pumps in case of insufficient water supply.

FLOAT SWITCH PROTECTION METHOD

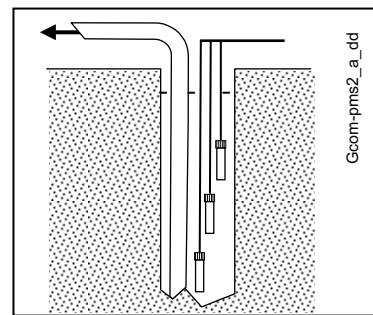

The float switch protection system is used when the water supply comes from open tanks. A float switch immersed in the tank is connected to the electrical panel.

If the water supply is insufficient, the float switch opens the electric contact and the pumps stop running.

ELECTRODE PROBE PROTECTION METHOD

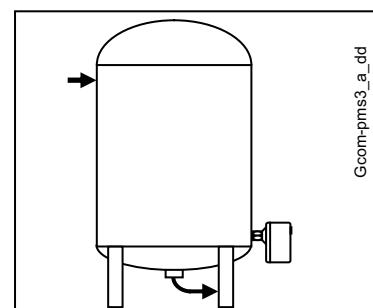

The electrode probe protection system is used when the water supply comes from open tanks or wells. A set of three probes is connected directly to the electronic board in the electrical panel. With the three electrodes immersed in the water, the relay on the electronic board closes the contact, enabling the starting of the pumps. If the water supply is insufficient, the control circuit opens the electric contact and the pumps stop running.

MINIMUM PRESSURE SWITCH PROTECTION METHOD

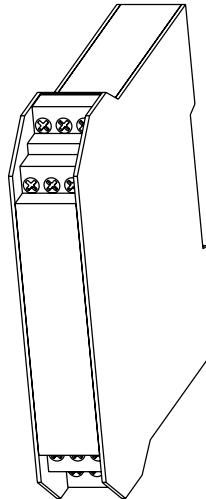

The minimum pressure switch protection system is used when the water supply comes from water networks or pressurized tanks. The pressure switch is connected to the electronic board in the electrical panel.

If the water supply is insufficient, the pressure switch opens the electric contact and the pumps stop running.

ELECTRONIC MODULE

Depending on the type and version of the installation (GVE, GVF, GVM, GVS) and on the total number of pumps, it is sometimes necessary to connect an additional external relay output module to the MASTER serial port of the SD60 unit. This module is necessary to control starting of the pumps if the relay outputs of the SD60 control unit are exhausted.

Key:

- A = Module of 5 relay outputs
- J = Presence of jockey pump
- R = Presence of standby pump
- B = 10 digital inputs module

TECHNICAL APPENDIX

**TECHNICAL
APPENDIX**

WATER REQUIREMENTS IN CIVIL USERS

Determination of the water requirement depends on the type of users and contemporaneity factor. The calculation may be subject to regulations, standards or customs that may vary from country to country. The calculation method shown below is an example based on practical experience, designed to provide a reference value and not a substitute for detailed analytical calculation.

Water requirements in condominiums

The **consumption table** shows the maximum values for each delivery point, depending on the plumbing amenities.

MAXIMUM CONSUMPTION FOR EACH DELIVERY POINT

TYPE	CONSUMPTION (l/min)
Sink	9
Dishwasher	10
Washing machine	12
Shower	12
Bathtub	15
Washbasin	6
Bidet	6
Flush tank WC	6
Controlled flushing system WC	90

G-at-cm_a_th

The **sum of the water consumption values** of each delivery point determines the maximum theoretical requirement, which must be reduced according to the **contemporaneity coefficient**, because in actual fact the delivery points are never used all together.

$$f = \frac{1}{\sqrt{(0,857 \times NrxNa)}} \quad \text{Coefficient for apartments with one bathroom and flush tank WC}$$

$$f = \frac{1}{\sqrt{(0,857 \times NrxNa)}} \quad \text{Coefficient for apartments with one bathroom and controlled flushing system WC}$$

$$f = \frac{1,03}{\sqrt{(0,545 \times NrxNa)}} \quad \text{Coefficient for apartments with two bathrooms and flush tank WC}$$

$$f = \frac{0,8}{\sqrt{(0,727 \times NrxNa)}} \quad \text{Coefficient for apartments with two bathrooms and controlled flushing system WC}$$

f = coefficient; Nr= number of delivery points; Na= number of apartments

The **table of water requirements in civil users** shows the maximum contemporaneity flow-rate values based on the **number of apartments** and the type of WC for apartments with one bathroom and two bathrooms. As regards apartments with one bathroom, 7 drawing points have been taken into consideration, while 11 points have been considered for apartments with two bathrooms. If the number of drawing points or apartments is different, use the formulas to **calculate** the requirement.

180	425	530	811	1056
200	448	559	854	1114

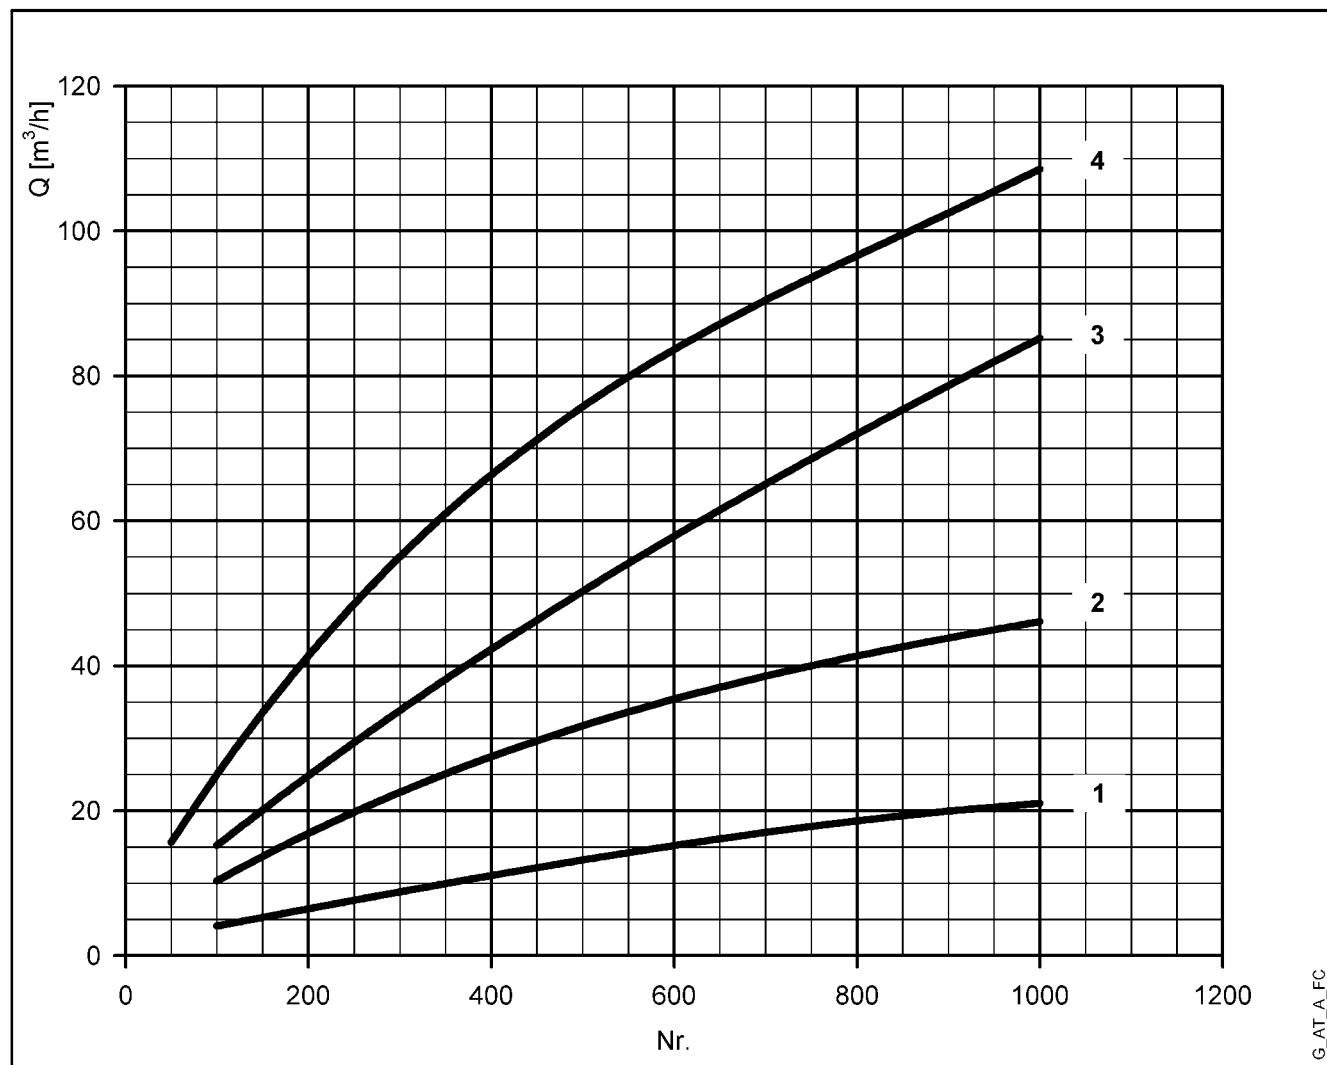

For seaside resorts, a flow rate increased by at least 20% must be considered.

G-at-fi_a_th

WATER REQUIREMENTS FOR COMMUNITY BUILDINGS

The requirements of buildings intended for specific uses, such as **offices, residential units, hotels, department stores, nursing homes** and so on, are different from those of condominiums, and both their global daily water consumption and the maximum contemporaneity flow rate are usually greater. The **diagram of water requirements for community buildings** shows the maximum contemporaneity flow rate of some types of communities, for guidance.

These requirements must be determined case by case with the utmost accuracy, using analytical calculation methods, according to particular needs and local provisions.

For seaside resorts, the flow rate must be increased by at least 20%.

- 1 = Offices (N. of people)
- 2 = Department stores (N. of people)
- 3 = Nursing homes (N. of beds)
- 4 = Hotels, residences (N. of beds)

USE OF BOOSTER SET

Water is usually delivered by public supply systems and the pressure is generally sufficient for the proper operation of the users' water and sanitary equipment.

When this pressure is not sufficient, booster sets are employed to increase water pressure and ensure an acceptable minimum value at the furthest points. Therefore, the water supply to a building, group of buildings or to a system in general can be considered satisfactory when all the user points can deliver the required quantity of water.

Set connection methods (intake side)

Water can be supplied to a booster set in two ways:

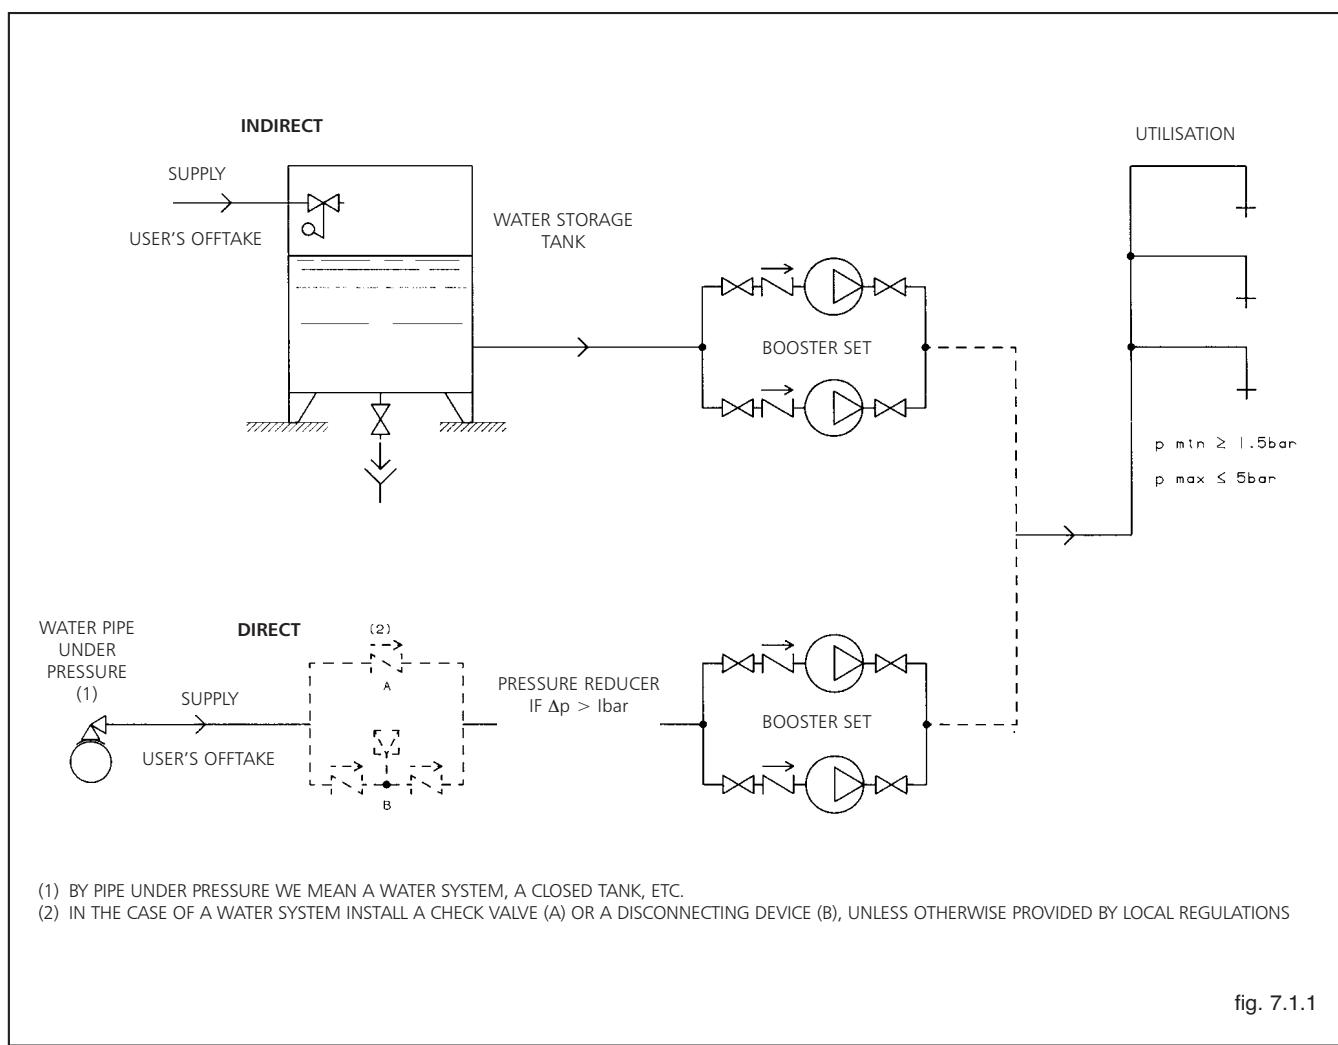

1 - By installing a water storage tank between the user's offtake and the booster set (indirect connection, fig. 7.1.1).

2 - By connecting the booster set directly between the user's offtake and the system (direct connection, fig. 7.1.1).

The indirect connection does not allow the water system pressure to be utilized. Therefore, it requires pumps with greater head.

The direct connection allows the water system pressure to be utilized, provided the pressure fluctuation (Δp) does not exceed 1 bar.

If it does, a pressure reducer must be installed for proper operation of the booster set.

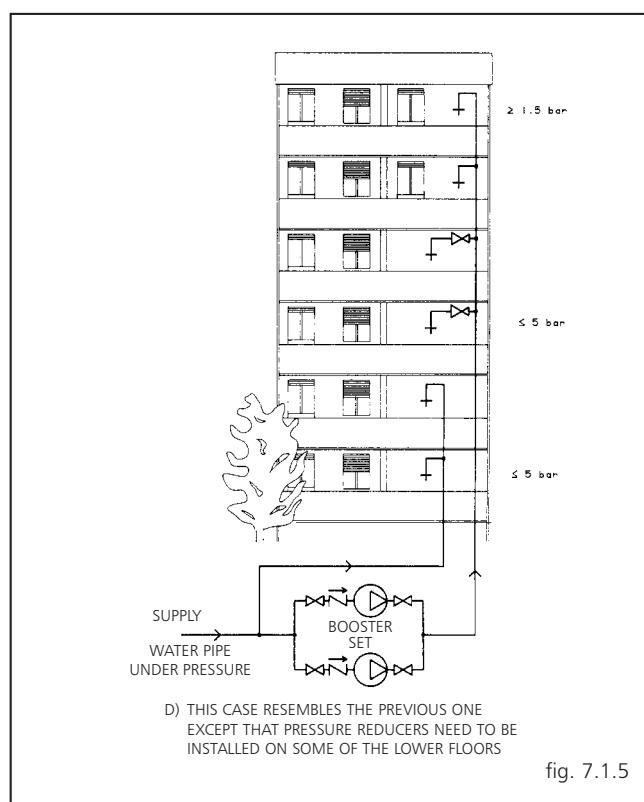

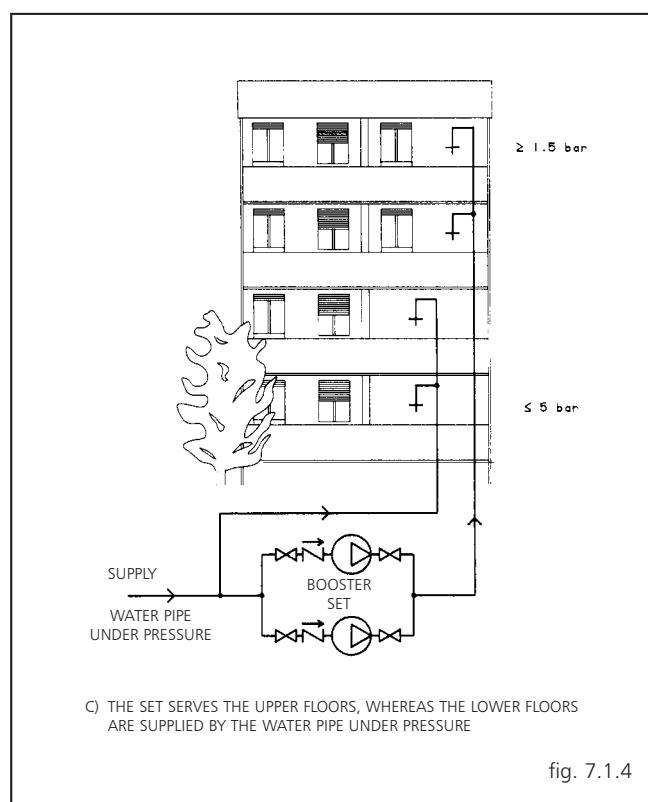

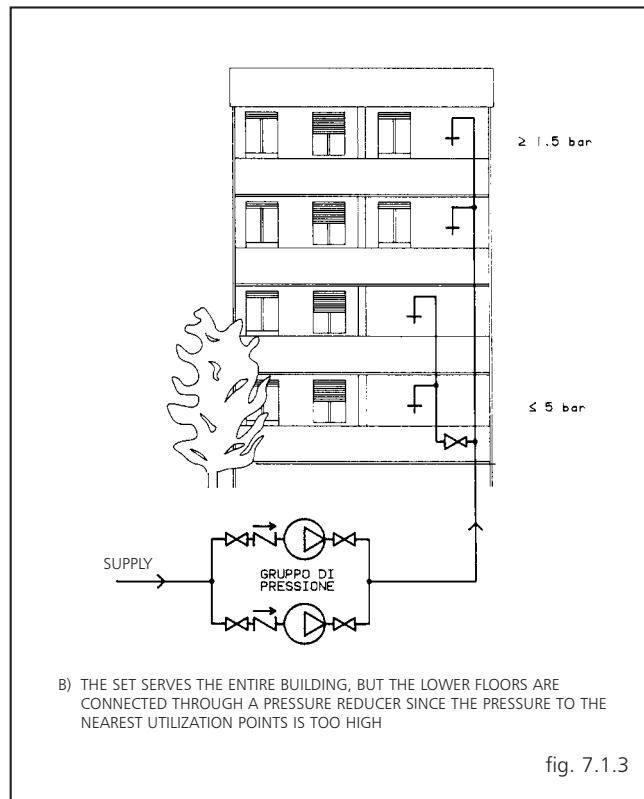

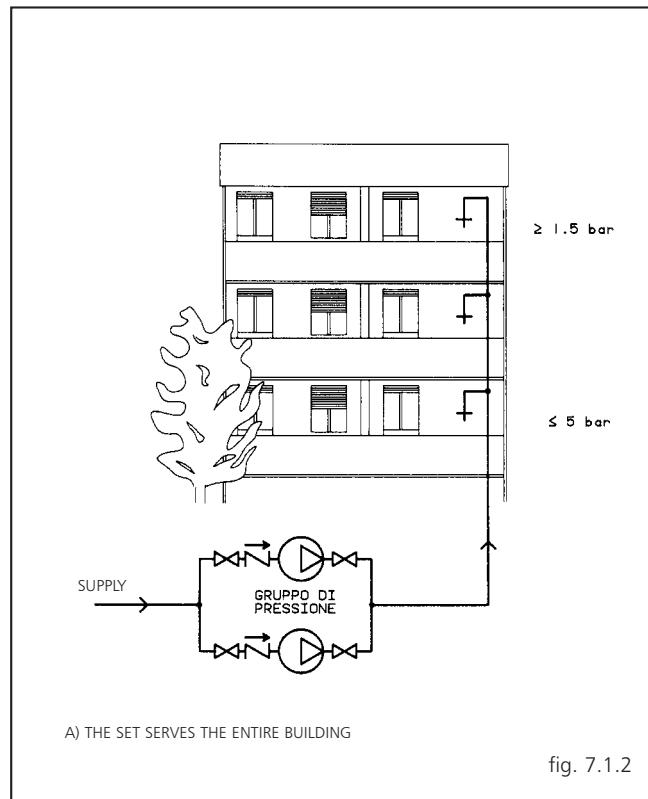

Water supply systems in civil buildings

The configuration of the supply system must comply with the following conditions:

- The minimum pressure ensuring the proper operation of the equipment must be guaranteed at the most unfavourable drawing point (1.5 bar for valves and flush tank WC, and 2 bar for controlled flushing system WC).
- At the most favourable drawing point, pressure must not exceed 5 bar.

Once these parameters have been satisfied, in relation to the height of the building and to the set intake conditions, the water supply system can have one of the following configurations:

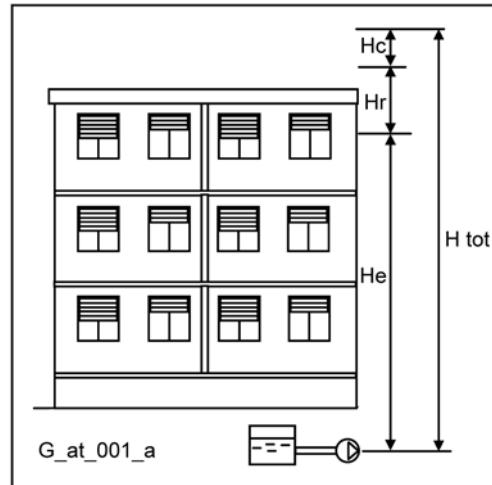

DETERMINING THE HEAD OF THE SET AND INTAKE CONDITIONS

Level intake

The delivery head of the set (H_{tot}) is the sum of:

- He : geodetic difference in level between the set and the furthest delivery point.
- Hc : flow resistance along all the pipes and through other system components, such as valves, filters, etc..
- Hr : pressure required at the most unfavourable point.

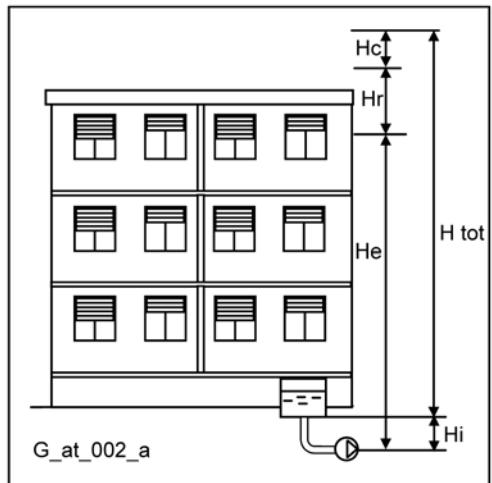

$$H_{tot} = He + Hc + Hr$$

Intake with positive head

In this case, the necessary delivery head (H_{tot}) will be reduced by the inlet pressure value (Hi).

$$H_{tot} = He + Hc + Hr - Hi$$

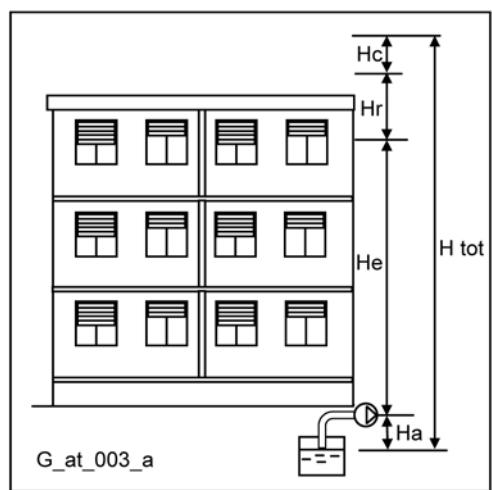

Intake with negative head

When the pumps suck from an underground tank or well, the necessary head will be increased by the value of the intake height (Ha):

$$H_{tot} = He + Hc + Hr + Ha$$

In this case the intake height must be considered very carefully, bearing in mind that an excessive difference in level between the water storage tank and the set, or the wrong sizing of the intake pipe, can have adverse effects on pump operation, such as cavitation and unpriming.

NPSH

The minimum operating values that can be reached at the pump suction end are limited by the onset of cavitation.

Cavitation is the formation of vapour-filled cavities within liquids where the pressure is locally reduced to a critical value, or where the local pressure is equal to, or just below the vapour pressure of the liquid.

The vapour-filled cavities flow with the current and when they reach a higher pressure area the vapour contained in the cavities condenses. The cavities collide, generating pressure waves that are transmitted to the walls. These, being subjected to stress cycles, gradually become deformed and yield due to fatigue. This phenomenon, characterized by a metallic noise produced by the hammering on the pipe walls, is called incipient cavitation.

The damage caused by cavitation may be magnified by electrochemical corrosion and a local rise in temperature due to the plastic deformation of the walls. The materials that offer the highest resistance to heat and corrosion are alloy steels, especially austenitic steel. The conditions that trigger cavitation may be assessed by calculating the total net suction head, referred to in technical literature with the acronym NPSH (Net Positive Suction Head).

The NPSH represents the total energy (expressed in m.) of the liquid measured at suction under conditions of incipient cavitation, excluding the vapour pressure (expressed in m.) that the liquid has at the pump inlet.

To find the static height h_z at which to install the machine under safe conditions, the following formula must be verified:

$$h_p + h_z \geq (NPSH_r + 0.5) + h_f + h_{pv} \quad ①$$

where:

h_p is the absolute pressure applied to the free liquid surface in the suction tank, expressed in m. of liquid; h_p is the quotient between the barometric pressure and the specific weight of the liquid.

h_z is the suction lift between the pump axis and the free liquid surface in the suction tank, expressed in m.; h_z is negative when the liquid level is lower than the pump axis.

h_f is the flow resistance in the suction line and its accessories, such as: fittings, foot valve, gate valve, elbows, etc.

h_{pv} is the vapour pressure of the liquid at the operating temperature, expressed in m. of liquid. h_{pv} is the quotient between the P_v vapour pressure and the liquid's specific weight.

0,5 is the safety factor.

The maximum possible suction head for installation depends on the value of the atmospheric pressure (i.e. the elevation above sea level at which the pump is installed) and the temperature of the liquid.

To help the user, with reference to water temperature (4° C) and to the elevation above sea level, the following tables show the drop in hydraulic pressure head in relation to the elevation above sea level, and the suction loss in relation to temperature.

Water	temperature (°C)	20	40	60	80	90	110	120
Suction	loss (m)	0,2	0,7	2,0	5,0	7,4	15,4	21,5

Elevation above sea level (m)	500	1000	1500	2000	2500	3000
Suction loss (m)	0,55	1,1	1,65	2,2	2,75	3,3

Friction loss is shown in the tables at pages 135-136 of this catalogue. To reduce it to a minimum, especially in cases of high suction head (over 4-5 m.) or within the operating limits with high flow rates, we recommend using a suction line having a larger diameter than that of the pump's suction port. It is always a good idea to position the pump as close as possible to the liquid to be pumped.

Make the following calculation:

Liquid: water at ~15°C $\gamma = 1 \text{ kg/dm}^3$

Flow rate required: $30 \text{ m}^3/\text{h}$

Head for required delivery: 43 m.

Suction lift: 3,5 m.

The selection is an FHE 40-200/75 pump whose NPSH required value is, at $30 \text{ m}^3/\text{h}$, $d_i 2,5 \text{ m}$.

For water at 15 °C

$h_p = Pa / \gamma = 10,33 \text{ m}$, $h_{pv} = Pv / \gamma = 0,174 \text{ m}$ (0,01701 bar)

The Hf flow resistance in the suction line with foot valves is ~ 1,2 m.

By substituting the parameters in formula ① with the numeric values above, we have:

$$10,33 + (-3,5) \geq (2,5 + 0,5) + 1,2 + 0,17$$

from which we have: $6,8 > 4,4$

The relation is therefore verified.

CHOOSING AND SIZING THE SURGE TANK

The purpose of the surge tank is to limit the number of hourly starts of the pumps, placing part of its stock of water, which is maintained under pressure by the air above it, at the disposal of the system.

The surge tank can be of the air cushion or diaphragm type.

In the air cushion version there is no clear separation between air and water. Since part of the air tends to mix with water, it is necessary to restore it by means of air supply units or a compressor.

In the diaphragm version, neither air supply units nor compressor are needed, as contact between air and water is prevented by a flexible diaphragm inside the tank.

The following method, which is used to determine the volume of a surge tank, is valid both for horizontal and vertical surge tanks.

When calculating the volume of the surge tank, it is generally sufficient to consider the first pump only.

DIAPHRAGM TANK

If you decide to use a diaphragm tank, the volume will be lower than that of the air-cushion tank. It can be calculated with the following formula:

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}}$$

where:

V_m = Total volume of the air-cushion surge tank in m³

Q_p = Average pump flow rate in m³/h

P_{max} = Maximum pressure setting (wcm)

P_{min} = Minimum pressure setting (wcm)

Z = Maximum number of starts per hour allowed by the motor

Example:

CN 32 - 160/22 pump

P_{max} = 32 mca

P_{min} = 22 mca

Q_p = 18 m³/h

Z = 30

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}} = 0,4 \text{ m}^3$$

A 500-litre surge tank is therefore required.

G-at-pct_a_th

hr = flow resistance for 100m of straight pipeline (m)

V = water speed (m/s)

FLOW RESISTANCE

TABLE OF FLOW RESISTANCE IN BENDS, VALVES AND GATES

The flow resistance is calculated using the equivalent pipeline length method according to the table below:

ACCESSORY TYPE	DN											
	25	32	40	50	65	80	100	125	150	200	250	300
	Equivalent pipeline length (m)											
45° bend	0,2	0,2	0,4	0,4	0,6	0,6	0,9	1,1	1,5	1,9	2,4	2,8
90° bend	0,4	0,6	0,9	1,1	1,3	1,5	2,1	2,6	3,0	3,9	4,7	5,8
90° smooth bend	0,4	0,4	0,4	0,6	0,9	1,1	1,3	1,7	1,9	2,8	3,4	3,9
Union tee or cross	1,1	1,3	1,7	2,1	2,6	3,2	4,3	5,3	6,4	7,5	10,7	12,8
Gate	-	-	-	0,2	0,2	0,2	0,4	0,4	0,6	0,9	1,1	1,3
Non return valve	1,1	1,5	1,9	2,4	3,0	3,4	4,7	5,9	7,4	9,6	11,8	13,9

G-a-pcv_a_th

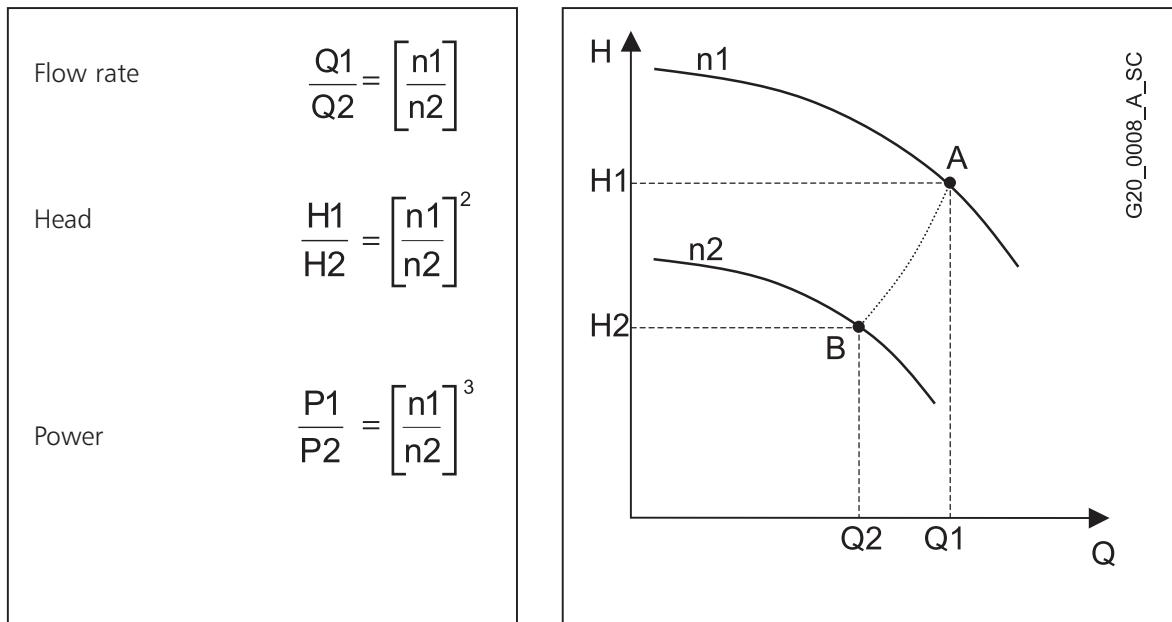

The table is valid for the Hazen Williams coefficient C = 100 (cast iron pipework). For steel pipework, multiply the values by 1.41. For stainless steel, copper and coated cast iron pipework, multiply the values by 1.85.

When the **equivalent pipeline length** has been determined, the flow resistance is obtained from the table of flow resistance.

The values given are guideline values which are bound to vary slightly according to the model, especially for gate valves and non-return valves, for which it is a good idea to check the values supplied by the manufacturers.

PERFORMANCE WITH VARYING SPEED EQUIVALENCE RELATIONS

Fitting the electric pump with a frequency converter makes it possible to vary the pump rotation speed, normally according to the system pressure parameter. **Variations in electric pump speed** result in **modified performances** according to the equivalence relations.

n_1 = initial speed;

Q_1 = initial flow rate;

H_1 = initial head;

P_1 = initial power;

n_2 = speed required.

Q_2 = flow rate required.

H_2 = head required.

P_2 = power required

Frequency ratios can be used instead of speed in practical applications, keeping 30 Hz as the bottom limit.

Example : 2-pole 50 Hz electric pump $n_1 = 2900$ (point A)

Flow rate (A) = 100 l/min; Head (A) = 50m

By reducing the frequency to 30 Hz the speed is reduced to approx. $n_2 = 1740$ rpm (point B)

Flow rate (B) = 60 l/min; Head (B) = 18 m

The power of the new work point B is cut to about 22% of the initial power.

SIZING THE DIAPHRAGM TANK IN SYSTEMS WITH SPEED VARIATION

Variable speed booster sets need **smaller tanks** compared to traditional systems. Generally speaking, a tank with a litre capacity of just 10% of the nominal capacity of a single pump, expressed in litres per minute, is needed. The **gradual starting** of the pumps controlled by the frequency converters reduces the need to limit the number of hourly starts; the main purpose of the tank is to compensate for small system losses, stabilize the pressure and make up for pressure variations caused by sudden demand.

Make the following calculation:

Set made up of three electric pumps, each with a maximum flow rate of 400 l/min, for a total capacity of 1200 l/min. The **volume** required for the tank is 40 litres. This size can be obtained by using two 24-litre tanks mounted directly onto the set's manifold.

The calculation establishes the minimum value needed for proper operation.

FURTHER PRODUCT SELECTION AND DOCUMENTATION**Xylect**

Xylect is pump solution selection software with an extensive online database of product information across the entire Lowara, and Vogel range of pumps and related products, with multiple search options and helpful project management facilities. The system holds up-to-date product information on thousands of products and accessories.

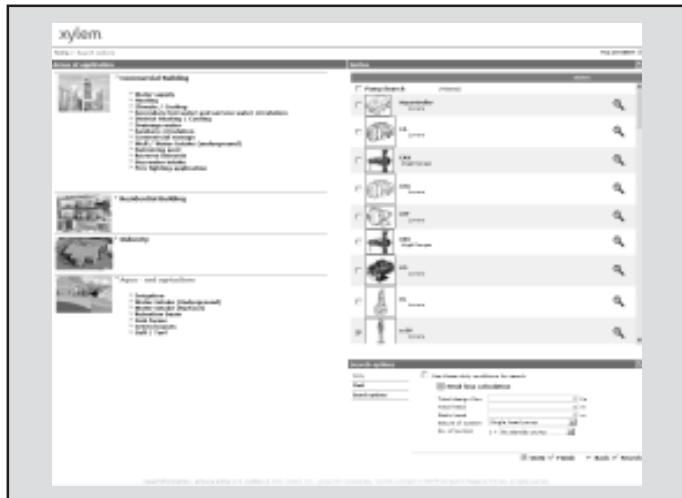

The possibility to search by applications and the detailed information output given makes it easy to make the optimal selection without having detailed knowledge about the Lowara and Vogel products.

The search can be made by:

- Application
- Product type
- Duty point

Xylect gives a detailed output:

- List with search results
- Performance curves (flow, head, power, efficiency, NPSH)
- Motor data
- Dimensional drawings
- Options
- Data sheet printouts
- Document downloads incl dxf files

The search by application guides users not familiar with the product range to the right choice.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect

The screenshot shows the Xylect software interface for selecting a pump. At the top, there's a navigation bar with 'Home', 'Search options', and 'Product configuration'. Below it, a table lists several Lowara 33SVB models with their item numbers, stages, discharge size, and other technical parameters. To the right of the table is a 'Performance curve 50Hz' graph showing Head [m] vs. Flow [m³/h]. The graph includes curves for different models like 33SVB and 33SVB220T, with specific operating points marked. A 'Current configuration' sidebar on the right contains various settings such as 'Stages: 5', 'Reference speed: 2900 rpm', and 'Motor manufacturer: Lowara'. At the bottom of the interface, there are links for 'Units', 'Print', and 'Finish'.

The detailed output makes it easy to select the optimal pump from the given alternatives.

The best way to work with Xylect is to create a personal account. This makes it possible to:

- Set own standard units
- Create and save projects
- Share projects with other Xylect users

Every user have a My Xylect space, where all projects are saved.

For more information about Xylect please contact our sales network or visit www.xylect.com.

This screenshot shows a detailed technical drawing of a pump model, likely a 33SVB, with various dimensions and views labeled. To the right of the drawing is another configuration sidebar, identical to the one in the first screenshot, showing details like 'Stages: 5', 'Reference speed: 2900 rpm', and 'Motor manufacturer: Lowara'. This demonstrates how Xylect integrates detailed engineering drawings with its product selection tools.

Dimensional drawings appear on the screen and can be downloaded in dxf format.

Xylem |'ziləm|

- 1) The tissue in plants that brings water upward from the roots;
- 2) a leading global water technology company.

We're 12,000 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

For more information on how Xylem can help you, go to xyleminc.com.
